THE scholarly editor of the *Boston Beacon* taking notice of the article "Metaphysics: the Use and Meaning of the Word," published in No. 64 of THE OPEN COURT, adds a few comments and quotations from Kant, as follows: "Metaphysics to some minds means 'that which lies behind nature.' This absurd notion was adopted by Schopenhauer, and pleases all dualists who think that the world is composed of mind and matter, just as they think men to be mixture of bodies and souls. Kant brushed away all such notions, and looked upon metaphysics as dealing with judgments that do not depend upon experience. The fact that the whole is larger than any of its parts is true without regard to our experience or to experiments. Accordingly Kant says that metaphysics deal first of all with a priori notions (R. V. 1757, p. xviii), that is, with notions that are true even if not put to a practical experiment, or as Kant himself says (l. c. p. 4), metaphysics deal with necessary

and severely universal truths. In a word, metaphysics may be described as "a priori science," or as a body of knowledge that deals in necessary conclusions from transcendental premises, that is, from propositions whose truth is independent of experience. No child ever reasons without having recourse to good or bad metaphysics. Metaphysics, therefore, may be said to be the most universal, and at the same time the least understood, of all sciences. Transcendental philosophy or metaphysics is "the system of all principles of pure reason" (Kant l. c. p. 27). The relation of metaphysics to every day thinking is about the same as is the relation of arithmetic to nature, or of optics to the use of our eyes. As we can see without knowing optics, but not without the law of optics, so we can reason without being metaphysicians, but not without obeying the laws of true or false metaphysics. Every man tries to be his own metaphysician, and generally succeeds—after a fashion. In the same sense every man is apt to be his own theologian."

## RECENT CONTRIBUTIONS TO "THE OPEN COURT."

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 55, 56, 57 and 58.

In the whole domain of Natural Science no field of investigation affords such a fascinating complexity of phenomena or such a varied wealth of vitality as the Kingdom of the Protozoans, the minute organisms revealed to us by the aid of the microscope. They inhabit the water we drink, the food we eat, the air we breathe. They live as parasites in the intestines and flesh of animals, and in plants; aiding or injuring their hosts, as the case may be. They lie dormant in a particle of dust, a legion in number. They roam free and unconfined in a drop of water, to them a world. Infinite in number, variety of size and manner of appearance, the same beings that the unaided vision of man cannot alone discover, form no unimportant factor in the construction of continents and in the configuration of the surface of the globe. They are the simplest known forms of life, and every contribution that throws light upon their mode of existence, cannot fail to be of transcendent interest to biologist and scientists in general.

M. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into this department of Life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling in these minute beings is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The articles have been translated from the *Revue Philosophique*, and the original cuts procured from the publishers.

## PROF. WILLIAM D. GUNNING.

A Memorial Address by Frederic May Holland. In No. 61.

Prof. William D. Gunning died at Greece, Col., on the 8th of March, 1888. His active and exemplary career of sixty years was devoted to the advancement of scientific thought, and marked by an uncompromising loyalty to truth. The memorial address, by Mr. Frederic May Holland, is a just and fitting tribute to a noble life.

## THE SPIRITUALIST'S CONFESSION.

By MONSIEUR D. CONWAY. In No. 63.

An interesting article upon the recent confession of the Fox Sisters at the Academy of Music, N. Y., with a short historical sketch of the Spiritualist movement in America and England.

## THE PROBLEM OF CAUSALITY.

In No. 55 is an editorial discussion of The Problem of Causality. The surpassing importance of this subject renders a clear conception of it absolutely indispensable to correct observation and sound reasoning. Despite this the problem has been unbecomingly neglected, and this neglect has given rise to innumerable errors and to an astounding lack of lucidity in scientific discussion. The problem is treated with clearness and precision; simplicity of presentation being especially aimed at.

The comments and discussions elicited by the article on "Causality" will be found to be especially instructive and elucidative. In Nos. 55, 59, and 60, Mr. William M. Salter advances a series of critical remarks, which are replied to in the same numbers by the articles, "Causes and Natural Laws" (No. 50), "Is There Anything Unknowable in Causation" (No. 59), "Is Nature Alive," and "The Stone's Fall" (No. 60). In No. 58, Mr. M. A. Griffen writes a letter upon the same subject; in No. 60, Dr. Edward Brooks, of Philadelphia comments upon the standpoint taken: all of which are accompanied by editorial comments.

## PLANTATION FOLK-LORE.

L. J. VANCE. In Nos. 47, 48, and 49.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

## THE HIBBERT LECTURES AND THE GAULISH PANTHEON.

By S. ARTHUR STRONG. In No. 63.

An instructive essay upon the purposes of the Hibbert Foundation, with a review of the recent lectures by Prof. John Rhys upon the religion of the ancient Celts. The original investigations of Prof. Rhys have thrown a new and welcome light upon the forms of belief in ancient Gaul, Wales, and Ireland, and they are regarded as a monumental work in the province of philological archaeology.

## DETERMINISM VERSUS INDETERMINISM.

Prof. GEORG VON GIZYCKI. In Nos. 55 and 56.

Georg Von Gizycki is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Contributions on the same subject have been published from L. F. Powell and Xenos Clark.

## REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

MRS. EDNAH D. CHENEY. In Nos. 49 and 50.

In Nos. 49 and 50 THE OPEN COURT publishes a paper upon Mr. Alcott's conversations, read by Mrs. Ednah D. Cheney before the Memorial Meeting of the Concord School of Philosophy. Mrs. Cheney's recollections of Mr. Alcott lead us back as far as the year 1840. The reminiscences cover almost a half a century of Mr. Alcott's intellectual life. Abstracts are given of his conversations, incidents described in which noted contemporaries figured, and anecdotes told illustrative of Mr. Alcott's life and thought.

Wheelbarrow, in No. 52, contributes an additional reminiscence of this "amiable philosopher and venerable man."

## GHOST STORIES.

By L. J. VANCE. In Nos. 59, 60 and 61.

The object of these studies in Comparative Folklore is not to account for every detail of every wild and senseless ghost story. Their purpose is to classify and compare the ghost lore of civilized and uncivilized peoples, and to show that the legends of the former are evolved from the savage fancies of the latter. The belief in the power and permanence of the souls of the dead is characteristic of savage nations. These beliefs have been retained by the uncivilized Folk of more advanced civilizations, and the senseless parts are to be regarded as 'survivals' of their earlier and cruder form. The main thesis of these investigations is, that the "supernatural stuff" of ghost stories is the same the world over,—whether in the hut of Bushman and Hottentot, or in the more elaborate illusions of a modern drawing-room *salon*.

## FREE TRADE AND PROTECTION.

By EDWARD C. HEGELE. In No. 62.

Political questions have not been introduced into THE OPEN COURT; but as the burning questions of the day must be judged from ethical principles, the problem of Protection or Free trade is here viewed from the religious, i. e., humanitarian standpoint. The general ethical law is: "Aspire to a higher humanity." How shall we attain to this higher humanity? by protection? by restricting other nations from competing with us? by taking advantage of temporary international circumstances? No. Experience shows that competition is the foundation of progress. The truly ethical policy is that which affords the greatest opportunities and offers the least obstacles to the onward movement of the human race. Thus, from the humanitarian point of view, protection fails to stand the test.

## ROBERT CLARK &amp; CO., CINCINNATI.

## NEW PUBLICATIONS.

## MASTER VIRGIL.

The Author of the *Æneid*, as he seemed in the Middle Ages; a Series of Studies by J. S. TUNISON, 8vo. \$2.00.

CONTENTS: 1. An Apology. 2. Virgil and the Devil. 3. Virgil in Literary Tradition. 4. Virgil's Book of Magic. 5. Virgil the Man of Science. 6. Virgil the Saviour of Rome. 7. Virgil the Lover. 8. Virgil the Prophet. 9. Virgil in Later Literature.

## Three Hundred Testimonies

In Favor of Religion and the Bible by Distinguished Men and Women. By REV. T. HARRISON, D.D., 12mo. \$2.00.

"The work is really rich and invaluable; it deserves a place in every library."—*Bishop Vincent, President of Christiana College.*

## NARRATIVE OF A JOURNEY

Down the Ohio and Mississippi in 1799-90. By MAJOR SAMUEL S. FOREMAN, of New Jersey, with a Memoir and Notes by LYMAN C. DRAPER, LL.D., 2mo; paper 50c., cloth 75c.

## Adventures of Pioneer Children;

Or, Life in the Wilderness. A Portrayal of the Part Performed by the Children of the Early Pioneers in Establishing Homes in the Wilderness. Acts of unequalled Bravery and Patriotism; Adventures with Wild Beasts and Brutal Savages, &c. By E. FEYJACK COLEMAN. Illustrated. 12mo. \$1.00.

## Sketches of War History, 1861-65.

Papers read before the Ohio Commandery of the Royal Legion of the United States. Illustrated with Maps and Drawings. 2 vols. 8vo. Net \$3.00.

## A Manual for Notaries Public,

General Conveyances, Justices, Mayors, Consuls, &c., as to Acknowledgements, Affidavits, Depositions, Oaths, Proofs, Protests, &c., for every State and Territory, with Forms and Instructions. By FLORENCE GRAYSON. Net, cloth, \$2; leather, \$2.50.

## Manual for Building and Loan Associations.

Embracing the Origin and History of Co-operative Societies; Objects and Benefits of Building Associations, Plans and Methods of Organizing and Conducting Them; Legislation; Constitution and By-Laws; Forms and Descriptions of Books, Blanks and Papers; Interest and Dividend Tables, and a comprehensive Variety of Practical and Useful Information and Suggestions. By HENRY S. ROSENTHAL. 12mo. \$1.50.

## Chromatic Chart and Manual of Parliamentary Law.

By J. ROSS LEE. 21mo. Stiff paper, 25 cents. Leather, 50 cents.

The "Chart" answers all the questions that are likely to arise in any assembly. It presents them instantly, fully, and plainly. No turning of leaves, no following of lines, no reading of abbreviations, but simply requiring a look, that is all; for the "Chart" shows at a glance everything needful to be known concerning each motion, and these needful things are presented to the eye, without the necessity of reading. It shows that the author has carefully mastered his subject.

## Chemical Experiments for Medical Students.

Arranged after BEILSTEIN. With extra blank leaves for Student's Notes. By W. S. CHRISTOPHER, M.D. 16mo. \$1.00.

The experiments cover work with the principal metals and acids, using Beilstein's examples. In addition, the more important alkaloids and some organic compounds of medical interest are considered. In physiological chemistry, the work deals with the proteins and carbohydrates, the digestive processes, blood, bile, milk, urine. The acid tests recently introduced for the clinical examination of stomach contents are also given. It may be used in conjunction with any systematic treatise on the subject.

## Alfred Kelley, of Ohio;

His life and work. By HON. JAMES L. BATES. (Privately printed; only a few copies offered for sale.)

The personal efforts and official life of Mr. Kelley are so intimately blended with the development of the resources of Ohio, with its commercial and financial prosperity, and with the establishment and maintenance of its credit, that this narrative necessarily includes much of these departments of the history of the state.

## The Life, Journals, and Correspondence of Rev. Manassah Cutler, LL.D.

By his Grandchildren, Wm. P. Cutler and Julia P. Cutler. Steel portrait and two views. 2 vols. 8vo. \$5.00.

## The Students' Law Lexicon.

A Dictionary of Legal Words and Phrases, with appendices explaining abbreviations, and references to reports, and giving the meaning of Latin and French maxims commonly found in law books. By WILLIAM C. COCHRAN. 12mo. \$2.50.

## FAMILY EXPENSE BOOK.

A printed account book, with appropriate columns and printed headings for keeping a complete record of family expenses, for each day, week and month of the year, with an itemized statement of expenditures for the year; also, a servant's account, showing name, date of engagement and rate of wages, with dates and amounts of cash payments. 12mo. Cloth, 50c.

Any of the above sent by mail prepaid on receipt of the price.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

MONCURE D. CONWAY, on Agnosticism, in No. 47.

Mr. Moncure D. Conway, in reference to the philosophical exposure of Agnosticism in the editorial article of Nos. 43 and 44 of *THE OPEN COURT*, declares that the Unknowable cannot in the least concern the religious nature. Only weariness of wing can have brought free thinkers to seek rest on this raft. Religion does not follow abstract and vague gods, it follows Jesus, Buddha, Mary, who may be known and loved. On the truth and moral value of these great figures, man can base his life. Mr. Conway concludes with the remark that the ethical side of monism has not as yet been made clear. Nature seems predatory and cruelly impartial between good and evil. Adherents of error survive more comfortably and increase more extensively than the disciples of truth. May it not be more truly said that there is a moral law in man to which nature must conform in order to be elevated and transfigured to a nobler existence? Mr. Conway's critical remark if it were unanswerable from the standpoint of Monism would drive religion and philosophy back into the dualism and supernaturalism of former times. And truly the supernatural, if it is justifiable at all, must be recognized in the moral nature of man, unless man is proven to be a part of nature. The editor's answer to Mr. Conway's criticism, in the same number, expatiates on the Oneness of Man and Nature, thus showing that humanity, culture and civilization are but a higher stage of the natural, and that morality does not stand in contradiction to, but is an observing of and a conforming to the cosmoical order of the All.

WHEELBARROW'S essays are contained in the following numbers of THE OPEN COURT:

WILLIAM L. POTTER.

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishism is means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

GEORGE M. GOULD.

In Nos. 24, 25 and 26 Mr. George M. Gould treats of "The Ethics of Economics" rather as a quality absent from our economic system than as a living principle belonging to it. His doctrine is that all things produced by human labor represent the expenditure of human life, and that dollars and dimes, being representatives of wealth or earnings, are as drops of precious human blood. Therefore, in order to a rightful ownership of dollars, we must earn them; we must return to society a share of our own lives equal to the quantity we have received from our fellow men. According to Mr. Gould, whenever we eat or drink we partake of a solemn eucharist, where "the shadowy ghost of humanity calls out to us: 'Take, eat; this is my body. Drink ye all of this, my blood which is shed for many.'" This is not to be understood metaphorically, he says, but "as an exact statement of the fact."

While perhaps the theory of economics presented by Mr. Gould may not be scientifically true in all its parts, the moral he draws from the actual facts of our industrial system is true enough for warning and for guidance. The partnership of capital and labor is the panacea of Mr. Gould, the solution of the labor question. But from his ideal plans of industrial emancipation he excludes unpleasant facts. He allows only *profit-sharing* to come in, and *loss-sharing* is never taken into calculation. Yet it is the possibility of loss that has thus far defeated the "co-operation" experiment. It is doubtful if the operatives in any great factory would accept the whole plant as a gift, if compelled to take it on the terms by which its owners run it, the chances of profit and loss.

There is some extravagance in his language, but that is only a measure of his benevolent impatience at the inequalities and wrongs which refuse to be cured by his remedies. That the "ethics of economics" lies in the doctrine of "equivalence for service" is very likely true, but there is a difference of opinion as to the correct measure of that "equivalence," and a still greater dispute as to the means by which that measure shall be legalized and enforced.

## WAR AND EVOLUTION: AN ETHICAL DISCUSSION.

BY PROF. CALVIN THOMAS.

Not long ago in reading a German periodical—it was the Berlin *Gegenwart*—I came across the following sentences purporting to be quoted from a work by one Dr. Lasson: "The result of war is always just, always a genuine judgment of God . . . War is the state's panacea and alone makes man truly man, that is, a rational *Naturwesen* . . . Therefore, national hatred is a good thing; for it maintains the permanent possibility of war."

I presume that this language excites in my readers the same emotion that it excites in myself, an emotion, namely, of indignation at the naked brutality of the sentiments expressed. At first one can hardly persuade himself that such talk can be seriously meant, and one is inclined to settle the matter peremptorily by remarking that this is the very philosophy that a wolf or an Apache Indian would write, if wolves and Apaches were in the habit of writing sociological reflections. Or, one thinks, perhaps, that it should be sufficient to say to the holder of such views: Suppose you were yourself some day to be attacked by a ruffian who chanced to be stronger or better armed than yourself, and after making such defence as you could, were to be maimed for life or killed: would the result be *ipso facto* right? Would it be a genuine judgment of God? Is it to this you would bring us with your struggle for existence and your law that the fittest survive?

One naturally inclines, I say, to make some such reply as this and to let the matter end there. Nevertheless, such a dismissal of the subject will hardly do for any one who believes in the possibility of a scientific ethics; will hardly do for one who holds that the sphere of natural law embraces everything that there is in the universe. For him it is necessary either to accept this philosophy, with all its brutality, as sound, or else patiently to show where it is unsound.

For there is no doubt that Dr. Lasson's doctrine is seriously meant; nor can it be treated as the isolated vagary of an individual. The words quoted were written several years ago, but a good deal of the same sort of "philosophy" is all the while finding its way into print at the present time. And this, not in Dahomey, or Tartary, but in the land of Goethe, Herder, and Schiller. The policy of "blood and iron" has done

more than to found the German Empire; it has prepared a congenial soil for the upspringing of a class of writers, who, in the name of science, seek to persuade us that war is not a survival of savagery, but is, and from the nature of things must be, a necessity; and not only this, but also that it is the grandest possible manifestation of national energy, and that the passions which provoke war and are provoked by it are among the noblest constituents of human nature.

Moreover, who can deny that the present order of things the world over gives some color of soundness to this philosophy? What is the creed in question, after all, but a translation into words of the logic of existing facts? Is not the situation about what it might be supposed to be if nature had really issued to the nations of the earth in some way a "last word" of some such import as this: Take care of number one and—*scabies extremum occupet*? Europe is, to use again the well-worn phrase, an armed camp where the nations are but waiting for a favorable opportunity for springing at one another's throats. The dissociation of religion, of human ethics, from practical statecraft is complete. Myriads of Christians are under arms, their energies withdrawn from productive avocations and their support resting as a heavy burden upon those who work, that they may learn to shoot and to march and to obey orders. And all to what end? In order that, when the occasion arises, they may kill and maim their fellow-Christians in as large numbers and as rapidly as possible. (If the cats of the world, without belonging to the same church, had organized for similar ends, how we should despise them for it.) Even in our own country, though we have but a very small standing army, there are indications enough that the war-spirit is as rife and as potent as it is elsewhere. In short, the process of civilization does not seem thus far to show even a tendency to do away with war. There never was a time when the so-called military virtues were more admired than at present. There is no other greatness so universally and so ungrudgingly honored as that of the successful soldier. Poets sing of him, and children are taught to honor his name just as in the days of Achilles. Methods of fighting have changed, but there has been no apparent diminution in the force of the passions that foment and wage war. The greed of selfish advantage, the prick

of offended pride, delight in discomfiture of an enemy, the courage to meet pain and death in battle, the enthusiasm of victory, the spirit of defiance—are all as potent in human affairs now as they were at the dawn of recorded history. In fact, it seems as if their potency had in very recent years been on the increase.

A hundred years ago the nobler spirits of Europe were speculating much upon the ways and means of abolishing war, and the outlook seemed to them hopeful. Seeing that the desolating wars of the past had usually resulted from court intrigue, personal ambition, or dynastic pride, it appeared but natural to suppose that in the incoming reign of reason, where governments should be carried on solely in the interest of the governed, the barbarities of war would drop out of human annals. The theme was a favorite one with philosophers, and did not lose its attractions even in the revolutionary and Napoleonic epochs. It was in 1795 that Kant wrote his essay, *Zum ewigen Frieden*, in which he laid down a few simple propositions that seemed to him fitted to serve as the basis of an international code that would insure a lasting peace. The idea of the universal brotherhood of man deliberately putting an end to the folly and misery of war, was one of the inspiring dreams of the early part of our century. Not much longer than a generation ago, Tennyson, looking out upon a world of nations, then as now "snarling at each other's heels," could still let his imagination range forward to the "parliament of man, the federation of the world."

But he would be a bold poet who should cast any such horoscope to-day; unless, indeed, he based his vision upon the theory that the frequency, the deadliness, and the misery of war, tend to diminish, as the machinery of war becomes more efficient for the destruction of life. In our generation the current seems to have set strongly against the realization of any ideal of human brotherhood. True, the ideal is not dead; men preach, and pray, and sing about it. It is a force in Sunday schools and missionary meetings. We have, too, our Peace Societies and Arbitration Societies. The Quakers, likewise, are still with us. But in the abodes of practical politics, of international statecraft, considerations derived from the brotherhood of man, or the barbarity of war, do not have the weight of a feather. If any one were seriously to mention such considerations, he would be called a silly sentimentalist. The reply to him would be: Your scruples will not do for this world. There is an iron decree that the nations must fight to live. It is hurt or be hurt, eat or be eaten. Or, if a people have conscience enough to refrain from encroaching upon their neighbors, they must at least be prepared to defend themselves against encroachment.

The attitude of mind that underlies the statesman-

ship of Prince Bismarck is described by his friends in this way: United Germany has a great and glorious mission to perform in the history of humanity. She does not desire conquest, does not wish to interfere with her neighbors. But on the other hand, she does not wish to be interfered with by others; she must have peace that she may be able to work out her own destiny in her own way. Therefore, surrounded as she is by jealous powers that care nothing for her welfare, but much for their own aggrandizement, there is no other course open to her but to make and keep herself strong enough to beat swiftly and surely any combination of enemies which can be brought to bear against her.

This is the kind of philosophy that now dominates the polity of the most highly civilized nations. Is it scientifically sound?

Let it be understood that I am here seeking merely to reason out a scientific problem. My aim is not to recommend a policy of "peace at any price," or any other specific rule of political action. The question is not of policies, but of principles; not of rules to work by, but of ideals to work toward. A man, even the best of men, is sometimes compelled by a present exigency to assume an attitude or adopt a line of conduct which, viewed abstractly, he does not approve and would not like to see made a general rule of action. So it may be with nations. Germany suffered bitterly a long time from weakness and disunion. It seemed *willing* to be trampled on and so it *was* trampled on. Now it has become strong and united and must be ready to maintain itself against aggression. This is right—that is, there seems to be no other path of safety. I have, therefore, no quarrel with any one who defends the present policy of the empire as a *temporary necessity*, or as a means of serving notice that Germany will no longer be trampled on. But let such person admit that the necessity itself is a terrible evil which it should be the aim of statesmanship to get rid of just as soon as possible. Let him say with Von Moltke that "war, even successful war is a misfortune," and a kind of arbitrament to be avoided by all honorable means. To do this is a very different thing from regarding the present militant attitude of the European nations toward one another as a "natural" and desirable condition. This is what certain writers apparently do, and do in the name of science and philosophy. It is this "philosophy" of which we ask whether it is sound.

If it is, then the outlook for a humanely disposed person is gloomy enough. For religion, the force to which it seems most natural to look for help, has shown itself singularly impotent to repress war. It has been historically a promoter rather than a restrainer of fighting. For eighteen centuries the Christian world

has had before it the command "Thou shalt not kill;" a command admitted to be of divine authority and reinforced in the most solemn manner by the precept of Christ. It is hard to see how religion based upon the supposed will of a divine being can furnish more cogent grounds of action than this. And yet the command of non-resistance issued by "the sublime mystic of the Galilean hills" has never shown the slightest potency to keep his professed followers from fighting. The bloodiest of wars have been fought in his name, and to-day, when two Christian peoples conclude to go to war with each other, this command of the master is about the last thing that any one on either side thinks of. On the contrary, the war is sure to be conceived by both parties as God's service, and that not only by the general mass, but by the very priests and saints of religion. Upon both sides godly men and gentle women who would go far out of their way to avoid hurting a kitten, deliberately send forth their sons to kill off their fellow-Christians by the thousand; and this they do with a prayer to the "God of battles" whom they always think of as fighting upon their own side.—In view of such facts, which no one questions, does it not seem as if only the most resolute optimist could look with much confidence to supernatural religious sanctions as a force likely to put an end to war?

But if not to supernatural religion, where shall we look? Have we a right to expect such a development at all? Are there any natural forces in operation that will tend to bring it about?

Upon this point I remark, in the first place, that the argument from practical necessity above alluded to—the argument that the nations must be ready to fight because the law of the world is a struggle for existence, in which the strongest prevail, and deserve to prevail—is just as applicable to individuals as to nations. In fact, it is in its application to individuals, if anywhere, that its real force is to be found. For a nation is only an aggregate of persons. Wherever any real struggle of opposing forces is going on, it is felt by individual men and women. It may be convenient for certain purposes of philosophical discussion to call the State "*Das Volk als wollende Person*," but we should not be misled by such an abstraction. The State is not a person, but a collection of persons, whose individual wills conflict variously with one another, and also with the wills of other persons belonging to other nationalities. It would seem, therefore, as if we should get some light upon our main question by inquiring what the practical result is in a society where the individual endeavors to maintain himself against opposing forces (it matters little whether these be members of his own or of a neigh-

boring tribe) by cultivating his muscle, going armed cap-a-pie, and assuming generally the *noli-me-tangere* attitude toward his fellow-beings.

Fortunately we are not compelled to imagine what happens under such conditions. History furnishes object-lessons by the myriad, and every one of them shows that the Bismarckian policy, when carried out by individuals in society, does not work. We find that in a state of affairs like that under consideration the guarantee of peace is at its weakest, and the opportunity for the individual to "work out his own destiny in his own way" simply does not exist. For a time, indeed, a particular bully, through the obvious superiority of his strength or of his arms, may overawe his fellows, but his reign is transient. Another soon appears who is not afraid of him, or two or three combine to pull him down. Feuds arise, and there is continual fighting, with the concomitant insecurity of life and property. The very habit of going armed and being always ready to fight tends to create easy and frequent occasions for fighting. Public opinion and private effort become mainly absorbed in those things that make for success in fighting, and other things that make for the symmetrical development of men as men, are neglected. Fantastic notions of honor arise. Physical courage, of the kind that dogs and savages usually possess in a high degree, and which in civilized men, if dissociated from moral courage, is as likely to do harm as good, acquires prodigious importance. The energies of the individual go very largely to maintaining his "honor" or proving his courage, and the result is that his freedom of movement, and so his development as man, are really impeded by his assiduous cultivation of the fighting virtues. This set of forces becomes, on the whole, a hindrance instead of a help to him in working out his higher destiny as a human being.

From this state of affairs another tends everywhere to evolve itself. In the lapse of time the right of free self-affirmation by means of physical force is taken away from the individual, and he is compelled to subordinate his belligerent instincts to a sentiment of justice embodied in public law. As this process goes on, it appears that the individual has been altogether a gainer. His faculties being no longer monopolized by those activities that make for the death or discomfiture of his fellowmen, his higher human capacities find room to assert themselves, and to grow. By surrendering the lower, illusory freedom of the savage, he has gained the higher, valuable freedom of manhood. And with his increased freedom has come, in a very real sense, increased strength. His total of virility has gained, and he is better able to maintain himself, and better worth maintaining, than was his

pugnacious ancestor. All this, we fancy, had been seen by Schiller when he wrote (speaking of man's position between God and brutes):

"Doch der Mensch in ihrer Mitte  
Soll sich an den Menschen reih'n,  
Und allein durch seine Sitte  
Kann er gross und mächtig sein."

But, now, is there anything that forbids us to apply to the nations this reasoning, which we find to hold good of individuals in society? None of importance that I can perceive. The forces that determine the career of a people are more numerous, their cross-play is more intricate, and requires a much longer time in which to "run down" than is the case with those that shape the destiny of an individual. But the forces are, after all, the same, and there is no good reason apparent why the causes that tend to evolve government by public law, from the anarchy of feudal *Faustrecht*, should not, in time, put an end to international fighting. Can there be any doubt that the world at large, and thereby every people in it, would be benefited in the same way and to the same extent by the suppression of war that a particular community is benefited by the suppression of private brawling? If all the energy and ingenuity which now go to perfecting the means for destroying human life could be released and turned into other channels, who can calculate the direct and indirect consequences that would ensue to the benefit of mankind?

Judging from the analogy of civil society, then, we have to look forward to an era in which the nations will recognize and act upon a paramount obligation to keep the world's peace. Standing armies will be reduced to a police basis, and international law will make it possible to combine the police forces of the world against any two ruffian peoples who should propose to fight out their quarrel instead of bringing it before the tribunal of the law.

This era will come about, not through some millennial change in the constitution of human nature, but from the natural play of forces now in operation. Sentimental considerations will make themselves felt. War is the most cruel and painful way of settling difficulties. Commercial and financial causes will come in; war is the most costly way of settling difficulties. A clearer perception of self-interest will work to the same end. At present, when our newspapers discuss the prospect of a general European war, their most common remark is that such a war would redound to the benefit of our country by affording an improved market for our products. But the time will come when our posterity will not look at things in that way. A fairly sensible undertaker hardly thinks of felicitating himself upon the prospect that a brace of ruffians in the street are about to engage in a fight that will result in death of one or both

of them. He does not think of his trifling interest in the sale of a coffin, but of the larger interest he has in common with all his neighbors in having a state of affairs in which ruffians are not allowed to fight upon the street. So it will be with regard to war when the general perception of self-interest shall become, let us not say more humane, but more correct, and a keener feeling for the solidarity of higher human interests shall have filtered down from the minds of the best into the minds of the many.

There are doubtless those who will smile at this as the emptiest kind of an empty dream, and I freely admit with M. Renan, that "la vocation du prophète est devenue dans notre époque singulièrement difficile." Still I venture to think that some such prevision, if we but allow time enough, rests upon substantial scientific analogies. It does not in the least require us to imagine men as becoming angels but only as learning by experience. Think of the mediæval baron as he existed, say in Germany, a few centuries ago. For him fighting was life's natural vocation. What would have been his emotions if some one had said to him some day, as he was riding out with his retainers to make war upon a neighbor, that in a few generations his descendants would not be doing that sort of thing at all; and not only that, but that they would have no wish to do it; and not only that, but that if they should attempt anything of the kind, millions and millions of people would straightway make it their joint concern to put an end to such proceedings? The change from then to now is really greater than from now to the epoch we have imagined.

The mistake which is often made in applying Darwinian conceptions to the facts of sociology is in putting too narrow a construction upon the phrase "struggle for existence." Struggle there must indeed be; this is the law of life. But with men and nations which have emerged from savagery this struggle is not a blind clashing of blind instincts, not a battle to the death for food and standing-room. It is still a struggle for self-maintenance and self-affirmation and in this struggle the fittest must and should possess the ground. But "fitness" has now become a very composite product, of which physical strength is at any rate but one factor. There are fossil mammoths among the nations as well as in the Siberian snows. In the aggregate of a nation's ability to maintain itself, there are many other qualities, as intelligence, industrial skill, enterprise, even virtue, that may count for more than physical strength. One of the "conditions" to which a national organism must continually adapt itself, is the state of human opinion; and of this the most important part is the general organized sense of justice. As a sociological force this is, in the end, stronger than iron-clads and breech-loading rifles.

Our reply, then, to those who urge that the pursuit of self-interest is the law of the world and that it is idle to preach against it, is this: Nothing is needed to put an end to war but a more enlightened selfishness. As a matter of practice, too, intelligence and sober reason, if men would but follow sober reason, could always find ways of attaining all honorable national ends without resorting to battle; ways, moreover, that would be less costly in every way, better for the interest of the parties concerned as well as for the rest of the world, and no less "glorious" if we but had more rational conceptions of what constitutes a nation's glory. But here comes in the difficulty that besets all progress: men do not act from sober reason, but from passion, instinct, and prejudice; and one of the strongest of all passions is patriotism—the descendant in civilized men of the tribal instinct of the primitive savage. Nothing, perhaps, is more characteristic of our century than the universal growth and strengthening of national sentiment. National feeling is really the dominant force in the world's politics to-day. And what is this sentiment for the mass of men? Usually a blind and bumptious vanity, hardly deserving a better name than chauvinism. It is the instinct that leads the average man in all countries to think as a matter of course, without investigation, that his own nation is the best on earth; that its ends are always righteous, and its methods commendable; that its men are the bravest and wisest, its women the brightest and fairest, its language the most melodious and forcible, its literature the richest, its history the grandest, and its destiny under the special and peculiar care of providence. It is the instinct which leads this same average man, while magnifying the good, and minimizing the bad qualities of his own people, to look down upon other peoples; to believe them false, or greedy, or otherwise immoral; to caricature and misrepresent them and to view them as enemies of God or of progress. Even among the educated how few there are whose patriotism rests upon a rational foundation, or who are at all open-minded when it is a question of comparing their own with other peoples.

And yet it is right here, if anywhere, that open-mindedness is particularly needed. It is a real educational need of our day that the schools of all countries should take hold of the work of rationalizing the patriotism of their pupils. The young everywhere should be taught to love their country for what is lovely and honorable in its history, but they should not be encouraged in the ways of chauvinism. They should be made to know and feel that loyalty to one's country is a noble sentiment but at the same time that it is not the only or the highest loyalty conceivable. They should be made familiar with the thought that, however much any one may owe to his own age and coun-

try, what he owes to all ages and countries is vastly greater; and that just as loyalty to one's city or state should acknowledge a higher loyalty to country, so this last ought to be merged in a still higher loyalty to what is good and great in the human record everywhere. Especially should the school aim to produce in this, as in other matters, a scientific habit of mind in the young. The school-boy, and no less the school-girl, should be encouraged to try to find out the *truth* about other nationalities, and to clear his mind of the cant and rubbish of national vanity. Our own country is not the one which needs least a pedagogical effort of this kind.

We are thus brought to take issue very decidedly with Dr. Lasson's doctrine that "national hatred is a good thing." To our thinking it is a very bad thing, and that not merely because it "maintains the permanent possibility of war," but because it is a stupendous obstacle in the way of getting the truth known and accepted as a basis of action. It tends to perpetuate falsehoods that rest upon nothing but ignorance and silly prejudice, and to make these falsehoods a prominent factor in international politics. In fine it makes for strengthening the hands of passion, instinct, and prejudice; whereas the growth of civilization in its highest or ethical aspect, means, to our thinking, nothing but the progressive subordination of human passion, instinct, and prejudice, to the dictates of sober reason.

#### PROFESSOR GUNNING ON MEMORY.\*

*Reprinted From No. 13 of THE OPEN COURT.*

You sit idly on a veranda in Florida, where the odor of flowers and blossoms regale you, but pass away. A woodpecker tells his song from a neighboring tree. Years pass and you forget it. You happen in the home of a professor in Indiana, and from a mocking-bird you hear the very song—the identical song—you heard from a woodpecker in Florida; while you were on the veranda a mocking-bird was perched, perchance, on the ridgepole and heard the song as idly as you, but its brain was a phonograph, and the symbols passed latent through five generations, when the phonograph began to unroll. In the common phonograph the words and tones of the human voice are latent in the dots and dashes of the ribbon, and the instrument speaks

\*The former editor of THE OPEN COURT who selected the interesting passage printed above, said in an editorial note on page 361 of THE OPEN COURT:

"Prof. W. D. Gunning gave a lecture recently at Keokuk, Ia., on 'Memory' in which he presented interesting facts and illustrations in support of positions which have been maintained in papers printed in this journal, by Mr. Edward C. Hegeler, Prof. Ewald Hering, and in abstracts of some of Ribot's works, prepared for and presented by Mr. Hegeler."

The extract from Professor Gunning's letter is reproduced in this number because of the relation it bears on the ideas set forth in the article "Spiritism and Immortality." Professor Gunning presents several wonderful examples of memory which extend through many generations and preserves not only certain notes of birds but even the same feelings connected with certain sounds.

back to you every word and tone. So the bird carries a chronograph in its brain. Where is Münchhausen with his story of frozen music which sang again as it thawed? Münchhausen told a story of a horse hitched to a church-steeple not so marvelous as the story which a horse tells of itself when it trembles at the scent of a lion it does not see, and when no odor of a lion had ever assailed its sense. How deeply were the attacks of the lion indebted on the brain of the horse perhaps five thousand years ago, and the phonograph again unwinds at a whiff from a lion's cage now.

Every organized being is such a phonograph. Darwin found the birds on the Gelapagos Islands so tame they would light on his hand. No man had been there to teach them dread. Since then men have frequented the Island, and now a bird at sight of man shudders as a horse at scent of a lion. The bird remembers how men stoned and shot his ancestors before he was hatched. At Rock Island the government forbids man to kill birds and articulate brutes. The memory of persecution is already fading from the memory of birds, turtles, and squirrels. Some had forgotten, some had dim recollection.

Under the touch of science instinct has stepped from its robes of kingcraft that held in awe the mind, and its name now is "unconscious memory." It is memory, physiological memory. Instinct may be called the "inherited experiences of a species."

Memory, in its lowest phase, is a function of organized matter. Limbs remember lessons of walking and walk automatically. The vast procession of life through ages of earth commensurate with the spaces of the heaven, ever widening, ever gaining new powers of perceiving, getting deeper emotions, never quite forgetting, until the age that it holds in unconscious memory all the ages foregone, and man is impacted memory of all yesterdays. The conception takes us into the inner temple of nature. Matter and mind are different phases of one fact. You know that the speech or song from the phonograph does not come from nothingness. It may be a mystery, but not a deep one to science; and if it were it would only type that deepest mystery, the unsolved problem of philosophy, the relation of the mind to matter.

The thoughts of man do not come from nothing; their underlying stratum is a gray, lace-like membrane. When you remember an incident of childhood it was indented on the life-stuff of the mind. The indented tablet gives up its record, and thoughts and fancies of the past flit across the field of consciousness. "Will you say that in assigning a natural basis to memory I am weighting matter with properties which it cannot carry?" But a few years ago elementary works on philosophy gave a full inventory of the properties of every form of matter. But who is there now whose

eyes are so clairvoyant over the realm of matter? Who could have thought that a sheet of paper could carry latent, as long as the paper endured, the tones of the human voice?

#### SPIRITISM AND IMMORTALITY.

*Spiritism* must be well distinguished from *Spiritualism*, although in popular speech the latter term is generally employed for the former. Spiritualism is that philosophical view which, in opposition to materialism, assumes spirit as the ultimate and universal principle from which the phenomena of the world are to be explained. Spiritism is the belief in spirits and the apparition of spirits. While spiritualism is a lofty conception of profound thinkers (such as Berkeley and Fichte) who boldly spiritualize the whole universe, spiritism, on the contrary, materializes even spirit itself and spiritual phenomena. With the spiritist the spiritual realm has become a world of spirits.

Spiritism, and the belief in spirits, may often have been occasioned either by successful impositions, or by mysterious phenomena, which for a length of time frustrated all attempts at explanation. But, ultimately, the origin of spiritism lies deeper; the source from which it is nourished, is man's longing for immortality. From the vague hope of life beyond the grave, and from the dread of being entirely annihilated, spiritism draws its strength; and all attempts at disclosing the deceptions of impostors, and at explaining certain marvelous phenomena which had been regarded as certain proofs by believers, will remain futile, so long as the spirit of man is considered as an entity, existing of itself and inhabiting the body during the time of life. The idea of immortality which is an exceedingly powerful factor in human emotions, must, in this combination, produce the most fantastical and nondescript errors, which, wherever they have been implanted, will take firm root in the human mind. Not that the errors possess that strength of themselves; they derive it from the truth with which they are mingled; and a total annihilation of ourselves is so utterly inconceivable, that we feel by an instinctive intuition, as it were, the truth of immortality.

The immortality of the soul is commonly understood to be the continuance of our conscious ego beyond death in the shape of a spiritual, bodiless being. This view rests on the principle that the soul is an entity which inhabits the body and can exist of itself; accordingly the ego is considered as a substance which is supposed to be the constant and continuous factor behind the transient states of consciousness.

The immortality of the ego stands and falls with the belief in a ghost-soul, and the only scientific evidence for the existence of a ghost-soul has been the supposed unity of consciousness. If our conscious-

ness were a substance, and if, as a substance, it possessed a unity, for instance like that of an atom, the ego of our consciousness would perhaps be indestructible. Kant's Critique of Pure Reason teaches that the ego, as an entity, is a fiction. We are aware of a series of ideas that become conscious in our mind. It is these ideas that are constantly present, but to consider consciousness as a substance that exists apart from its contents of ideas is an illusion, a fallacy or paralogism of pure reason. Modern investigations in physiological psychology show that the ego, with its chains of conscious and subconscious states, is the product of many factors under very complicated conditions. The ego forms a unity, *i. e.*, a unitary complex, or a compound system; but, of itself, it is not a unit. The *Einheitlichkeit* of the soul must not be construed as a rigid and ultimate *Einheit*. In a similar way the French school of experimental psychology, foremost among them Th. Ribot and Alfred Binet, have proved that the ego is not an entity constituting the "cause" of mental phenomena, but, on the contrary, that the ego is the "effect" of certain phenomena of mental activity. If this ego, as an entity, is an illusion, how can it be immortal? If a ghost-soul does not exist, how can it continue to exist? If a consciousness independent of its contents, which are the ideas that become conscious in our mind, has no reality, how can we attribute to it a permanence in *eternum*?

Although a ghost-immortality of disembodied spirits is impossible, man's existence is not a fleeting phenomenon of an ephemeral nature. His soul-life is not of yesterday, and does not vanish into nothingness to-morrow. His ideas as well as his actions are facts that continue to be factors in the future development of his race. The life of a single individual is not a separate and single event that begins with his birth and disappears again at his death. It is the product of a long evolution of many thousands of generations. Their works and thoughts live in the present generation, and our soul-life, our thoughts, accompanied with the same kind of feelings, will continue to exist in the future. Those who think, who act, and who feel like ourselves, possess our souls,\* and in them we shall continue to live and move and have our being.

It is objected that, as a rule, people do not care for such an immortality; they want the immortality of a ghost-soul. This is undoubtedly true, but whether they care or not, it does not alter the facts. If people do not care for this grander kind of immortality, they must be educated to appreciate it.

A Christian missionary in Greenland told his Esquimaux converts much about their future life in heaven, and when he was asked whether there would be plenty of whales and seals and walruses, and

whether the redeemed would have enough cod-liver oil, he suggested that they would no longer want such things. The Esquimaux then turned away and said: "What is the use of your heaven if there are no whales, nor seals, nor walruses, and if we can have no cod-liver oil. If such things don't exist, and if the most glorious joys are not even desirable in heaven, we don't care for it at all."

Similarly among us, those people who believe that the soul is a ghost which inhabits the body, do not care for any immortality unless it be that of a ghost-soul. They do not care for continuing to live in the life of mankind, and are satisfied to hover about as spirits, communicating with their beloved ones through raps and other primitive manifestations. They are like the prodigal son, who left his father's house and fed upon husks for want of better food.

All the most marvelous feats of mediums do not attain to that wonderful perfection for which our best performers in legerdemain are famous. The ingenious way in which they present their clever deceptions is also truly remarkable. The worst thing about spiritism is its dearth of ideas. The spirits show in their communications an extraordinary lack of spirit. If the manifestations were as true and undeniable as daylight, they would reveal a most pitiable state of spirit-life, "sans teeth, sans eyes, sans taste, sans—everything."

It is impossible to convince a spiritist of his errors simply by showing that he has allowed himself to be duped—so long as he believes in the immortality of a ghost-soul. The idea of immortality is strongly implanted in the human mind, because every living being feels that life cannot be annihilated; as Goethe says:

No being into naught can fall,  
The eternal liveth in them all.  
In All-Existence take delight,—because  
Existence is eternal; and fixed laws  
Preserve the ever living treasures  
Which thrill the All in glorious measures.

This consciousness of our indestructibility is so direct and immediate that, in a healthy state of existence, we feel an eternity of life in every moment, and only with the assistance of much contemplative thought and earnest reflection can we conceive at all the idea of death. Even if this earth, the intellectual life of which has found its consummation in mankind, should break to pieces and make a further and direct continuance of our ideas, our actions, and our soul-life impossible, we know that new life will grow from the wrecks of our world; that new suns will shine upon new planets peopled with new generations, who, like ourselves, will aspire to the same aims and struggle for similar, perhaps even higher, ideals.

The idea of immortality resting on a true instinct,

\* Compare THE OPEN COURT, page 396, first column, lines 1-11.

and on the natural conviction of the indestructibility of life, cannot be easily blotted out from the human mind, even though mixed with errors. And the idea of immortality need not be eradicated; we have simply to weed out the errors that grow around it by the slow and long process of patient education. Those who have freed themselves of the old errors that have attached to the conception of immortality look smilingly upon their former views, as the man thinks of his having been a child with childlike thoughts. As the Apostle says: "When that which is perfect is come, then that which is in part shall be done away. When I was a child, I spake as a child, I understood as a child, I thought as a child; but when I became a man, I put away with childish things."

The old view of considering our ego as a real entity is, as the sacred Hindoo religion expresses it, the veil of Maya that lies upon our eyes. The man who recognizes this ego to be a sham has become a Buddha, *i. e.*, a knower—one who knows; one from whose eyes the veil of Maya has been taken. He no longer lives the sham-life of egotistic desires that moves in the circle of never satisfied wants, but he has entered Nirvana. The annihilation of the ego is the condition of a better life, of a broader and higher existence.

This truth, though not fully realized in Buddhism, was nevertheless presaged by its great founder, Gautama. It has been mixed with pessimistic vagaries and monstrosities, but has at the same time afforded comfort to millions of people in their troubles and cares and agonies of death. This same truth is the basis of the Christian religion also, whose founder demands a surrender of our egotistic desires. Christ says: "Whosoever shall loose his life shall preserve it."\* And this same truth lies at the bottom of all true ethics. We must entirely surrender our ego and regulate all our actions by a maxim fit to become a universal law (as Kant expresses it). By lifting all our thoughts and intents to the broader interests of promoting life and of promoting higher forms of life, we cease to be single and separate beings, and become the representations of cosmic life, or in biblical terms, "The householders of God."

The surrender of the ego is a destruction of self and of selfishness only, but it does not imply, as has been assumed by pessimistic teachers and by the monks of a world-despising attitude, an annihilation of our existence and of life generally. It does not mean death, but life; not inactivity, but work; not destruction, but immortality. It means life and progress and aspiring labor, not in the service of egotistic purposes,

but for the evolution of existence in higher forms, for the development of our race and the realization of the ethical ideal.

All labor for egotistic purposes would be vain, for, we shall die, and the purpose for which we have worked would be gone. But if we consider ourselves as householders who stand in the services of a higher purpose than ourselves, if we aspire for a further evolution of cosmic life: the purpose of our lives will not die with us; we shall continue to live in our deeds and thoughts and in those who are inspired by the same ideals; as Schiller says:

"Art thou afraid of death? Thou wishest for being immortal?  
Live as a part of the whole; when thou art gone it remains."

This view of immortality is not less, not smaller and more meager, than the immortality of a ghost-soul, whose very existence is an unwarranted assumption. It is more; it is grander and sublimer; although those who have the veil of Maya upon their eyes, who still believe in that sham-entity of the ego, cannot understand and appreciate it.

Johannes Tauler, of Strassburg, one of the profound mystic preachers of the beginning of the fourteenth century, said: "*Wir müssen entwerden, um Gott zu werden.*"\* Our ego must be undone in order for us to become God. The higher life of immortality will be ours; but the price to be paid for it, is a surrender of the sham-existence of our ego. P. C.

## CORRESPONDENCE.

### SPIRITUALISTIC COMMENTS.†

To the Editor of THE OPEN COURT:—

To any one acquainted with the varied facts and phenomena which have forced many logical minds to admit that those who have lived in the flesh, now being called Spirits, can and do under certain conditions communicate with the living, and all those thus familiar with the facts only smile to read such articles as that of Mr. Conway in No. 63 of THE OPEN COURT. \* \* \* Denying those facts is simply loss of time to the objector, but he must make himself acquainted with them and then explain them if he can without reference to the dead, and I for one will be under lasting obligations to him. He is the very man I have been looking for for fifteen years. If all the commercial mediums in the world would renounce the whole thing and announce before the world that they have been practicing fraud and deception and nothing but fraud and deception, it would not have a feather-weight on my mind in relation to the facts on which I rest the irresistible hypothesis of spirit-existence and communication. T. W. W.

To the Editor of THE OPEN COURT:—

Mr. Moncure D. Conway points with ardent zeal to the folly and stupidity of the converts to a woman's deception. \* \* \* He alludes to a combination of favorable conditions, and names one, the dry and combustible state of religious growths. I would name one other at least, a waiting world. People of every sect and of

\* Quoted from memory.

† The above are extracts from letters to THE OPEN COURT from Spiritualists, commenting upon Mr. M. D. Conway's remarks upon Spiritualism in No. 63 of THE OPEN COURT. "Lay Reader," in omitted parts of the letter, vindicates the whole list of eminent men criticized by Mr. Conway for their spiritualistic beliefs.

\* The same idea is almost literally (though with the addition of "for my sake") repeated over and over again. Luke xvii. 33; Luke ix. 24; Matt. x. 39; Matt. xvi. 25; Mark. viii. 35; John xiii. 25; John x. 17.

none, had for long noted the raps and other occult phenomena. \* \* \* Science, probing what we were taught in the books to call matter, was pressed and crowded with watching and formulating its astounding transformations, could not look or listen, and cried: "One world at a time." Those whose mental gear possessed unity saw no "other" world—no hard and fast line walling out the unknown, a "Thus far and no farther", and sought—and continue to seek, to bring the occult phenomena of an unexplored state of matter into the field of observation and demonstration endowed with the concept of unity. They acknowledge nothing as discovered from the whole, and wait in contumely and calumny, seeking and treasuring data, until the rank and file of sciences shall have quarried the distance between them. In this course they relinquish all thought of the rewards and honors bestowed by a consensus of the Scientific Guild, well knowing they are only for those who attain tangible results for the market.

Mr. Conway brings ridicule, contempt, and aspersions, on these gifted and unselfish people. He sees them in phantasmal (?) procession "solemnly pressing their lips to the toe of the Fox woman," again he announces them as "at the feet of vulgar tricksters, when the fraud is united with unctuous sentimentalism," and again he hints an impeachment of their testimony in the special field of their professional labor. \* \* \*

The climax of Mr. Conway's free use of the illustrious list of names he introduces, is when he charges Dr. Alfred Wallace with having "smothered by emotional enthusiasm the brain which discovered the law of evolution." How will he verify the aspersions? Two years ago Dr. Wallace was called to America to fill the same position satisfactorily filled by Professor Tyndall fifteen years earlier, that of Lowell Lecturer in Boston. He made the tour of our cities. He wore the snowy crown of age, but no one has recorded that his brain was clouded or his natural vigor abated. Within a few weeks I have seen a small cast sent by him to a friend in America. The light in the eye is remarked by all who see it—not a very sure proof of decadence of intellect. \* \* \*

He throws stones while his own house is glass. The Fox sisters he calls imposters. If that is true, then they have been imposters for forty years. Does confession rehabilitate them? Able detectives are well-known to be shy of confessions. They are easily manufactured. They often recount awful deeds that have no existence but in the diseased imagination. There is a shrewd suspicion held by many who have no theory to build or destroy, that mediums being so plenty as to glut the market, the novelty of the exposé was devised, but that, too, is becoming *passée* and the sisters may yet appear in a new rôle and amend their confessions. It is also claimed by those who have taken much care to inform themselves that the "tricks" are genuine phenomena. You pay your money and take your choice. Mr. Conway accepts the confession as genuine and announces himself a convert in the outset of his article. He enlarges on the "abnormality" of the big toe, and says "toes able to hammer" were not numerous. However, that may be the toe-theory is not a new one. A New England divine, in the days following the Rochester knockings, cracked his toes to public audiences but he made no converts. Mr. Conway listened from a distant balcony to Miss Fox's toes and was converted on the testimony of a single sense. Figuratively he "presses his lips to the toe of the Fox woman," he "sits at the feet of a vulgar trickster." \* \* \* In spite of the sudden conversion by the penitent sisters, and his indulgence in the "human emotion" of a hope that the sisters will tell the whole truth and nothing else, Mr. Conway's real nature asserts itself, and the scent of delusion clings to him still. He pleads with them "to give the whole thing away," and seems to expect they will. But interest fails. The show at the Academy of Music has long been common in any country town where the expenses incurred were not above the ready money-resources of the actors. It was a stroke of business genius in the

manager of the Foxes to take the Academy of Music in New York and win a convert like Mr. Conway, out of his own field of Historic Criticism. \* \* \* LAY READER.

# PROFESSOR COPE'S PROPOSITION OF MARRIAGE CONTRACTS FOR TIME.

To the Editor of THE OPEN COURT:—

That the marriage tie, as at present existing, is a species of tyranny which falls very heavily on both men and women, I am far from denying. I have lived in many countries, and have known of few marriages which I could honestly consider satisfactory. It appears to me, however, that Prof. Cope's proposed five years' system bears almost as heavily on women as their present loss of freedom. Unless I misunderstand him, the woman whose marriage becomes a dead letter at the end of five years is to return to her father's, and either support herself, or be supported by her parents.

The objections to such an arrangement are all too apparent. Allowing that she brings no children with her,—and this would not usually be the case,—would she be satisfied to return to her old home and, virtually, place herself again under her parent's control? Could younger sisters and brothers be expected to welcome her? Would not the five years of absence have weakened their affection for her, hers for them? Finally, in the event of her bringing two or three children into a household of adults, would she not be entirely unwelcome? What an injustice to her parents, who have brought up a family of children, to expect them, in old age, to bear the annoyance of grandchildren.

It may be said that, according to Prof. Cope's plan, the father is to support the children. Be it so; but while the wife is earning her daily bread, being deprived of her husband's support, who is to care for children of a tender age? It is also an open question if the woman could earn her living. We will say that she has married on the five years' system, and at the time of her marriage was between twenty and thirty years of age; that she has borne her husband three children. Child-bearing and nursing will not only have occupied her entire time, but will have told on her health, her spirits, and her looks. During those five years she will have had neither the health, nor the time, necessary to establish any business relations, and she will have no business habits, which should be acquired early, as we all know. In fact, five of the most valuable years of her life will have been wasted on a man who breaks the tie that binds them, against her wishes, and gives her no equivalent.

We have to pay for most of the desirable things which we get in this world, and it seems to me but fair that if a man breaks the marriage contract, against his wife's desire, he should pay for so doing, since he takes from her what, because of her connection with him, she has learned to regard as her support. The rupture means nothing to a man, regarded from a practical point of view. His business goes on just the same, and instead of living in his own house, he boards, until such time as he forms another connection.

Prof. Cope takes it for granted that the woman will re-marry. This is by no means so certain. A woman, with two or more children, worn by bearing them, anxious as to her own means of support, and passed the freshness of youth, is not especially attractive to the average man. Moreover, she may be weak enough to regret her recreant husband, and men hate a gloomy woman. Any man who can earn a decent living, it is worth some woman's while to marry; but there are any number of women who have absolutely nothing to offer any man, to all outward appearance.

The effect on society of the changes advocated by Prof. Cope would be, indeed, curious. No married women would dare to have their girl friends in their houses. And young married men would see their "replacant" in every man who was civil to their wives.

If all girls were taught a trade, the advantages would be more

equally divided between the sexes. Perhaps nothing could be much worse than the existing state of things; certainly nothing could more endanger the health of the community than the awful system of prostitution which the present state of society tolerates. It is productive of ever-widening circles of misfortune.

Divorce, at all events, might be made optional. Once separation is really desired by either party, happiness becomes impossible. But until "the family" takes a different place in our social system this seems all we can do. The family is essentially for the individual. It has its foundation on the great ego. Men make a virtue of working for wife and children; but all the consideration the wife and children command comes from the fact that they belong irrevocably to the man. I once thought the family the highest outcome of civilization; but of late years I begin to fear that it is the foe of what is broad, free, and noble.

M. M. E.

#### THE MARRIAGE PROBLEM AND ETHICS.

Prof. E. D. Cope's essay discusses the Marriage Problem in a serious and considerate manner, and it deserves a careful attention. But we do not believe that his remedy of a contract-system for a definite number of years is desirable or practicable. All that can be done in the way of legislation is a more humane and equitable law of divorce. Otherwise we can expect the removal of much unnecessary suffering solely through the slow means of educating public opinion. Society is but too apt to judge harshly of every single case, where a marriage for some reason or other has proved a failure. The unfortunate ones, whether at fault or not, have often, in addition to all their troubles, to bear the opprobrium of a lifetime.

The remarks of Mrs. M. M. E., a literary lady who speaks from experience, undoubtedly possess much weight. The contract-system of Professor Cope would perhaps be worse than the present system is; and we may on this occasion state that Professor Cope, in his private letters, has in so far expressed his assent to our views as to say that he also believes that an alteration of the present laws will be of no avail unless public opinion be educated. To educate public opinion was his main purpose in writing the essay.

Professor Cope correctly states that "the union of a man and a woman in the social relation is not the creature of law but the laws are its creatures." We must not imagine that we can produce social conditions by laws. It is just the contrary; our laws are expressions of certain social conditions which have been developed in a natural evolution. Nature works out higher forms of individuals as well as of institutions, and we, the single individuals of the human race, have simply to obey her behests. By a willing obedience we can enhance, but by a willful resistance we can retard progress. We can even make any further evolution impossible and sink into a state of marasmus. Monogamy, as Professor Cope has set forth in his essay, has proven to be the basis of a higher civilization, and therefore it has instinctively, as it were, been regarded as a holy institution.

It is a great mistake on our part to imagine that the sole, or at least main, purpose of marriage is the happiness of the individuals concerned. We are mere instruments in the hands of nature who but too often cares very little for the happiness of individuals. The individuals have to sacrifice themselves, their lives, their labor, and their aspirations, to the aims of nature, and they must find their highest satisfaction in being or becoming useful tools for working out the progress of mankind. Let a man or a woman enter into marriage with an expectation of attaining personal happiness or comforts, or worldly goods and benefits, or of having henceforth an easy time, that marriage is sure to be a failure. But let both husband and wife be animated by the spirit of self-sacrifice not only in mutual love but mainly in the idea of attending to the higher duties of a progressive humanity, that marriage is sure to be full of

troubles and cares, full of work, self devotion and of anxiety, but in most cases it will be enriched with that elevating bliss which is unknown and unknowable to the self-seeker.

The solution of the marriage problem as we understand it, can be accomplished by education only. Public opinion must be educated. People must be taught that the purpose of life is not enjoyment or happiness; and the education of public opinion has to commence with our children. Let us educate our boys and girls, our youths and maidens, so that they think first of their obligations, that they look upon life as the performance of duties and upon marriage as a self-sacrifice for the purpose of working out the higher aims of mankind. Marriages are too often entered into in a wrong spirit. Hedonistic and utilitarian ethics have poisoned the feelings of the great masses of the people; and there are but few who are far-sighted enough to see that happiness is sure not to be gained if eagerly sought for. The more hastily it is pursued, the more quickly it flees from us. Happiness is a mere shadow, and if we rather seek for the satisfaction which is found in a faithful performance of duty, it will follow voluntarily and naturally. Happiness will never and must not fill our whole lives but there will be enough of it to give an agreeable zest to life. What would a life be that is brimful of happiness and lacking earnest labor and ideal aspirations, and what would a marriage be without cares and anxieties?

An alteration and even an improvement of our present marriage laws will accomplish little or nothing unless it be accompanied by an improvement of morals and of the ethical views which shape the morals of the day. A solid foundation of ethics is truly the burning question of the day; it lies at the bottom of all reforms, and without it you may continue to patch and mend in places, but no real reform, permanent in its nature, will be possible.

P. C.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXVII.

The Sovereign seated himself on one of the rustic chairs, pointing at the same time to another. "Do not let me interrupt your work. I am taking a walk, and beg to be allowed to rest myself for a moment here."

"The work is in idle hands," answered Ilse, "I was looking at the castle, and thinking how large the household must be that requires so much room."

"It is an old building," remarked the Sovereign. "Many centuries have contributed to increase it, and yet, in the opinion of the officers of my household, it is not large enough. One easily increases one's requirements. But then, again, one rejoices in withdrawing into a smaller abode. I myself once lived in this pavilion, alone, with only a few necessary servants. Such solitude does one good."

"That I can imagine," replied Ilse, sympathizingly. "But to such as we are it is something new to see so grand a style of life. The castle and its grounds with the blooming trees, are like large precious stones set in gold. It gives me heartfelt pleasure to have so near a view of your Highness's home; it helps to give one an idea of the mode of life of our gracious Sovereign."

"Then you still consider yourself a child of our country," said the Sovereign, smiling.

\* Translation copyrighted.

"That is natural," answered Ilse. "From my childhood I have heard of your Highness as our ruler; whenever I looked in the newspaper I saw your Highness's name; everywhere I have seen your Highness's pictures; and, since I have been old enough to go to church, I have prayed for your Highness's happiness and health. This is a bond of union; it is, indeed, only on one side, for your Highness cannot care about us all, but we think and care much about our ruler."

"And speak of him sometimes with dissatisfaction," replied the Sovereign, good-humoredly.

"Just as it happens, gracious Prince," replied Ilse, honestly. "One does not always speak well of one's neighbors; but, in serious matters and in trouble, a good heart shows itself. So it is with the Sovereign, each one forms his own idea of him according to circumstances, trusts in him, or is angry with him, and ends by thinking that he and his prince belong to one another."

"It were to be wished that so good a feeling might be shown by every subject," rejoined the Sovereign; "but fidelity is wavering, and personal attachment disappears."

"Many know too little of their Sovereign," said Ilse, apologizing. "How can they care for him when they see so little of him? For seeing does much: we at Rossau have seldom the honor of setting eyes on our prince."

"The feeling of that country has been described to me as unsatisfactory."

"We are situated in a distant corner, but we have a heart. Your Highness will scarcely remember the maidens at Rossau, who received you seventeen years ago at the triumphal arch. There were twenty; the little town could not produce any more. They all wore the national colors on their bodices and petticoats; they, of course, had to buy the dresses themselves. One of the maidens was miserably poor, but she was pretty, and did not like to be left behind, so she worked the whole week during the greater part of the night, in order to procure money for her dress. In her last illness, for she died young, she asked to be buried in this dress, as that day had been one of greatest honor and pleasure to her. But your Highness was hardly able to stop there; you drove quickly through the triumphal arch, and, perhaps, did not even see the maidens."

Whilst Ilse was speaking, she was secretly strewing bread crumbs beside her. The Prince observed her hand, and she excused herself.

"The finches call to their gracious Sovereign, 'Give, give!' The little ones are very tame here."

"They are probably fed by the servants," said the Prince.

"To love animals is the custom of our country!"

exclaimed Ilse; "and tame birds suit well with a royal castle, for all here should feel joyful confidence."

The Sovereign's glove fell to the ground, and as the loyal Ilse quickly bent down to pick it up, the Sovereign's eye rested for a moment upon her head and form. He rose slowly. "I hope, Madame, that you will be of the number of those joyful ones who place confidence in the possessor of this spot. As master of the house, I have made inquiry after the health of my new lodger. I wish that you may feel here some portion of the pleasure that you know how to impart to others."

He civilly acknowledged Ilse's respectful curtsy, and returned to the castle.

There the Chamberlain waited to report to him concerning the health of the Hereditary Prince.

"His Highness is unfortunately still obliged to keep to his bed."

"He must take care of himself," replied the Sovereign, graciously, "and not leave his room too soon."

#### CHAPTER XXVIII.

##### IN THE PAVILION.

The splendid iris colors wherewith Ilse had at first adorned her new abode gradually faded. As, instead of the steward and lackeys by whom she was received, there was now only a single servant, in a dark coat, to assist Gabriel, so everything else that surrounded Ilse appeared now in the modest colors of common earthly life. This was natural, and Ilse herself said so to her husband. But there was one thing she did not like: she was separated from her husband more than in the city. The morning and a portion of the afternoon he worked in the museum, and devoted many hours also to his own object among the archives and records of the Marshal's office, whose private offices were willingly opened to him. When he returned home he had sometimes to dress in haste for the Court dinner, and Ilse dined alone. However attentive the servant might be in bringing up the numerous dishes, the lonely meal was uninviting and sad to her. But a great many evenings were spent in a new entertainment: a Court carriage used to stop at the pavilion, and convey her and her husband to the theatre. When for the first time she entered the private boxes near the stage, she rejoiced in the comfortable position, which allowed her to give her attention to the performance undisturbed by the public. When she leant back in her box she saw nothing of the spectators, except the Sovereign's seat opposite. The theatre was very grand, much richer in decorations and costumes than she had seen in the city, and there were some good singers at the opera. Absorbed in the performance, she did not remark with what cu-

riosity she was regarded by the public, and that the Sovereign's opera glass was often directed towards her. She soon found that the theatre was the best amusement of the capital, and her husband took care that she should not miss this recreation, although he, perhaps, would have preferred remaining with his books, or examining a bundle of records from the archives. Between the acts, Ilse looked with curiosity down upon the people, who were all strangers to her, and said to Felix: "This is the only occasion upon which I have ladies near me."

During the day she felt her solitude. Her father had a mercantile friend in the city to whom she made a point of going the first day, but in the family of the little merchant she found no one to suit her. According to the advice of the Chamberlain, she went round with Felix to pay visits to the Court ladies. In most of the houses no one was at home, and she had to leave cards. Rarely were these visits returned; and it always happened that on her return home from the city, or from a walk in the gardens of the castle, she found the cards of some lady. This was annoying to her, for she wished to try how she could get on with the ladies. Some of the gentlemen of the Court, indeed, used to present themselves to her in the morning,—the Chamberlain and the Grand Marshal,—but the visits even of the Chamberlain became shorter; he looked depressed, and spoke of little but the continued indisposition of the Hereditary Prince.

Ilse was very anxious to know the Princess. The second day after her arrival the Chamberlain announced that her Highness would see the Professor and Madame Werner at a certain hour. Ilse stood with her husband amidst the silk and gilding of the royal room; the door flew open, and a young lady in half mourning swept in. Ilse recognized at once that she was the sister of the Hereditary Prince: a delicate refined face, the same eyes, only more lively and brilliant, and an enchanting smile played round the delicate mouth. The Princess bowed her small head gravely, said a few civil words to her, and then turned to Felix, with whom she immediately entered into lively conversation. Ilse observed with admiration the ease of her manner, and the tact with which she could say kind things; she soon discovered what an active mind lay concealed within that lovely form, and that her husband's answers were instantly followed by intelligent remarks on the part of the prudent lady. At the close of the visit the Princess turned again to Ilse, and said how much her brother lamented that his illness deprived him of the pleasure of seeing her. The words and tone were very kind, but there was a pride and princely dignity in the manner which hurt Ilse. When the Professor on their return spoke with warmth of the charming lady, and exclaimed,

"That is an uncommonly bright mind! Like her outward appearance, her inward spirit has a fairy grace about it!" she was silent; she felt that her husband was right, but she also felt that the Princess had excluded her from the footing of intimacy which she had accorded to her Felix.

Being in this state of mind, she was surprised and pleased at one mark of attention which was shown her. Since her interview with the Sovereign the head gardener brought her every morning, at the same hour, a vase of the most beautiful flowers, with the compliments of his Highness. This was not all: a few days after the Sovereign came again, when Ilse was sitting, as before, in front of the door. He asked whether it was not advisable, on account of the slight breeze that had sprung up, to enter the house; she took him into the room; he sat down there, and asked, as if accidentally, whether she was well entertained, and had found any acquaintances in the city. He took so much interest in her that Ilse said to her husband, when he returned home, "How mistaken are the opinions that one forms about strangers! When I came here I thought the Sovereign was a thoroughly reserved man, but I find him very friendly, and he seems quite a good family man too; but with such a large household it may frequently be necessary to be strict."

The Sovereign's short visit was repeated. The next time he found the Professor with his wife. On this occasion he was more serious than before.

"How were you satisfied with the Hereditary Prince?" he asked the Professor.

"Those who instructed him praised his industry; among the students he gained popularity, and there was general regret at parting from him."

The Sovereign remarked the word popularity.

"How did the Prince contrive to gain this?"

"He showed an upright character and decided will, and one felt confidence in him."

The Sovereign gave a searching look at the Professor, and perceived from his calm manner that this was not empty civility.

"The attachment of the students showed itself on the departure of the young Prince by a festive serenade," interposed Ilse.

"I know," replied the Sovereign. "I assumed that Weidegg by his endeavors contrived to have this done."

"It was of their own free will, and showed their warm feeling," added the Professor.

The Sovereign remained silent.

"He won the hearts of the ladies also," continued Ilse, "and we lamented his Highness's absence from our tea-parties."

(To be continued.)

## BOOK REVIEWS.

THE HOME OF SHAKESPEARE. Boston: 1888. Louis Prang & Co. Christmas Edition. \$3.00.

A volume of charming illustrations representing the scenes of Shakespeare's life. Each illustration is accompanied by an extract from the poet's writings, fitly describing the scenes represented. The contents include the Poet's Home, the Grammar School, the West Gate, Guy's Mill, Warwick Castle, Kenilworth Castle, the West Tower, the Old Mill, the Bridge, Anne Hathaway's Cottage, the Weir's Walk, Holy Trinity Church, the Avenue, the Tomb, and other scenes of the Stratford-on-Avon and its surroundings. To every lover of Shakespeare it will be a most fitting Christmas gift.

BABY'S LULLABY BOOK. *Mother Songs*. Boston: 1888. Louis Prang & Co. Christmas Edition. \$7.50.

With hearts of song or sorrow,  
Cloud-hid or shining sky,  
To-day, and, yea, to-morrow,  
You'll sing the lullaby—

are the opening lines to this handsome and elaborate work of art. "Cloud-hid or shining sky," through every phase of joy or sorrow in life, the love and womanly care of generations have woven a web of ideal happiness about the life of infancy. The tender associations of baby-life are the poetry of the world of mothers. Many a jewel of thought, of sentiment, and of life-experience, has been lost in the multitude of joys and sorrows peopling this epoch of life, yet many have found a lasting place in the realms of rhythm, music, and color. Babies have gained a citizenship in literature, and Messrs. Prang & Co. are to be congratulated for their happy contribution to the treasure-store of mother-songs.

The poems by Charles Stuart Pratt, twelve in number, have been set to music by Mr. T. W. Chadwick. Accompanying the songs are full-page illustrations by W. L. Taylor. The colors are soft and delicate; the pages are set in frames of solid tint. The cover is of surah sateen with fine and attractive designs. In all, a beautiful Christmas present.

ESSAYS IN CRITICISM. Second Series. *Matthew Arnold*. London: 1888. MacMillan & Co. Chicago: A. C. McClurg & Co. \$1.50.

The collection of essays contained in this volume was made by the late Mr. Arnold himself. A further recognition of their worth than the approval of the author, who was as severe in his estimate of his own productions as he was clear and unbiased in the criticism of others, no one could demand. Unlike the majority of his contemporaries, who endeavor, in the treatment of every subject, to cover the whole province of human opinion, Mr. Arnold was content to say one thing at a time. The perusal of an essay of his is certain to leave an idea, an impression. It has been objected to him that the invariable repetitions in which he indulged grew to tiresomeness. But the objection has arisen from the dearth of other noticeable defects. No method, in the hands of a skillful author, is better fitted to fix the ideas of a reader and to preserve the unity of critical treatment. In this simplicity of method, Matthew Arnold became a teacher of men. The collection before us illustrates this power. The essays are respectively upon the following subjects: "The Study of Poetry," "Milton," "Thomas Gray,"

"John Keats," "Wordsworth," "Byron," "Shelley," "Count Leo Tolstoi," "Amiel." Precision, unity, and purpose, mark them all. The unbiased American reader will appreciate many remarks upon the character and tendencies of Anglo-Saxon institutions,—remarks akin in spirit to the animadversions recently made in the essay upon "Civilization in America."

muon.

GREAT FRENCH WRITERS, MONTESQUIEU. By *Albert Sorel*, VICTOR COUSIN. By *Jules Simon*. Translated by Melville B. Anderson and Edward Playfair Anderson. Chicago: A. C. McClurg & Co.

The above form the third and fourth volumes in a series of unusual interest and merit, which has before received notice in these columns. M. Sorel gives us a very instructive study of Montesquieu, combining a just and sympathetic account of the man with a critical analysis of his works, giving most space, naturally, to *L'Esprit des Loix*. This word "spirit," the author tells us, did not belong to him alone, but had been used by another celebrated French writer, Domat, in his "Treatise on the Laws"; Montesquieu's use of the term was to show reason for the existence and efficacy of the law, which made his problem an historical one. The author writes at some length on the subject of Montesquieu's style, who was as much artist as thinker, "who desired perfect order in his book, but an order which steals into the reader's mind without imposing a burden on his attention." It was this attention to the form of his work, doubtless, that has given us so many maxims. The three most popular writers in France when the revolution broke out were Voltaire, Rousseau, and Montesquieu; among them Montesquieu furnished to the ardent disciples of liberty and a new social order the most quotations, all parties drawing from his great work maxims and precedents to support their wishes and claims."

In the study of Victor Cousin we come nearer our own time by almost a hundred years. The revolution is past, but its results not wholly established as yet, when the striking figure of Cousin appears in the arena of French philosophic ideas and discourse. The story of the brilliant popular success which the author of the Eclectic Philosophy attained almost at a bound in his lectures at the Sorbonne as the successor of Royer-Collard, has always read like a romance and is heightened in interest by M. Simon's account of the popular teacher's early life. Cousin was one of the first among the French to appreciate the depth of his countrymen's ignorance of German philosophy, an ignorance which he shared, though he had the merit to try at once to correct it. He was the friend and disciple of Hegel, but he was himself more of a rhetorician than a philosopher, a brilliant but not profound expounder of other men's systems rather than the originator of one of his own. C. P. W.

## NOTES.

We learn that Mr. Edmund Collins, retiring from *The Epoch* to take charge of Leng's Literary Syndicate, is succeeded as literary editor by Mr. L. J. Vance, already a regular contributor to that journal as well as to *THE OPEN COURT*, and an occasional contributor to *The Critic*. Mr. Vance's father, John Vance, was for many years one of the editors of *The Sun*, when the paper was owned by Moses S. and Moses Y. Beach.

## ★ RECENT CONTRIBUTIONS TO "THE OPEN COURT." ★

## PROF. WILLIAM D. GUNNING.

A Memorial Address by Frederic May Holland. . . . In No. 61.

Prof. William D. Gunning died at Greeley, Col., on the 8th of March, 1888. His active and exemplary career of sixty years was devoted to the advancement of scientific thought, and marked by an uncompromising loyalty to truth. The memorial address, by Mr. Frederic May Holland, is a just and fitting tribute to a noble life.

## THE ETHICAL BASIS OF CHARITY.

W. ALEXANDER JOHNSON.

The Editor of *The Reporter*, an organ of Organized Charity, Chicago, speaks not only from experience but takes the scientific aspect of this most vital problem. The basis of Charity must not be sought for in the surtenance of a pauper class who would not exist but for charity. The basis of Charity must be sought for in ourselves and our ethical nature. To this truth the principles and methods of doing the work of Charity must conform.

## THE QUESTION OF IMMORTALITY

Is treated in the Editorial of No. 25, "Evolution and Immortality." It is shown that Immortality according to the Monistic view is immanent; it is a continuance of ourselves in our children, in our ideas and in the work we have done during life. Rudolf Weyler in his essay, "THE PUNISHMENT OF DEATH," in No. 24, speaks of death as a mere transition and C. Billups in a letter of No. 23 criticizes the wrong notion of a transcendent immortality as taught by Dualism.

## LEE AND SHEPARD'S NEW PUBLICATIONS.

## A WESTERN BEAUTY.

**DAYS SERENE.** Original illustrations by MARGARET MACDONALD FULLMAN. Engraved on wood by George T. Andrew, and printed under his direction. Royal oblong quarto. Emblematic cover. Twenty-six full-page, original illustrations. Full gilt. Size, 10 1/2 x 14 1/2. Cloth, \$3.00; Turkey morocco, \$12.50; tree-calf, \$12.50; English-seal style, \$9.00.

## SEPIATINT NOVELTIES.

Something new, attractive, and decidedly original.

## A CHRISTMAS CAROL.

By DINAH MARIA MULOCK, author of "John Hall-fax." Illustrated by J. Pauline Sinter. Printed on heavy board in sepia tint and gold, gilt edges, ribboned and boxed, \$1.00.

## "A FRIEND STANDS AT THE DOOR."

By DINAH MARIA MULOCK, author of "John Hall-fax." Illustrated by J. Pauline Sinter. Printed on heavy board in sepia tint and gold, gilt edges, ribboned and boxed, \$1.00.

## ALL AROUND THE YEAR.

A charmingly illustrated calendar for 1889. By J. PAULINE SINTER. Consists of beautiful original designs, on heavy board, in sepia tint and gold, gilt edges, ornamented with rings and chains in silver, with silk tassels, and boxed, 50 cents.

## THE REGAL BEAUTIES.

Printed on extra super-calendered paper at the University Press. Gilt edges. 50 cents each.

A title justly designating one of the most original and beautiful series of LEE & SHEPARD'S HOUSEHOLD FAVORITES, yet offered. The size is large, 10, 8 1/2 x 14 inches. The covers are the best quality of heavy Bristol-board with pebbled surface, ragged edge, and original water-color designs by American artists, each cover containing two beautiful pictures. The following eight favorites have been selected for this unique style:

*Nearer, My God, to Thee; Home, Sweet Home; Dora, by Tennyson; Rock of Ages; Abide with Me; Curfew Must Not Ring To-Night; O Why Should the Spirit of Merlot be Proud? My Faith Looks Up to Thee.*

## THE DAINTY MINIATURES

Include twelve of LEE & SHEPARD'S FAVORITES in particularly attractive dress. Covers of heavy Bristol-board with pebbled surface, ragged edges, and decorative illustrations in manifold water-colors and gold.

These little volumes are "as dainty as the leaf of a lily," of exquisite design, each cover displaying a work of art. The favorites selected for this style are:

*Curfew Must Not Ring To-Night; Rock of Ages; Gray's Elegy; O Why Should the Spirit of Merlot be Proud? Home, Sweet Home; Nearer, My God, to Thee; My Faith Looks Up to Thee; The Cleverest Song of Old; It Was the Calmest Silent Night; The Breaking Waves Dashed High; King of the Wild; Abide With Me.*

Price, enveloped, gilt edges, 25 cents each. Illustrated on every page.

## The "Peerless-Jerome Art-Books."

## NEW EDITIONS.

All original illustrations engraved on wood. Miss Jerome will publish no new book this season, she being entirely occupied in the preparation of a work for next year which is confidently expected will surpass all her former works.

## A BUNCH OF VIOLETS.

Gathered by LAENE E. JEROME. 410, cloth, \$1.75; Turkey morocco, \$9.00; tree-calf, \$9.00; English-seal style, \$9.00.

## One Year's Sketch Book.

In same bindings and at same price as "Nature's Hallelujah."

## NATURE'S HALLELUJAH.

Elegantly bound in gold cloth, full gilt, gilt edges, \$9.00; Turkey morocco, \$15.00; tree-calf, \$15.00; English-seal style, \$10.00.

## The Message of the Bluebird.

Told to Me to Tell to Others. Cloth and gold, \$2.00; Palatine boards, ribbon ornaments, \$1.00.

## Lee &amp; Shepard's Good Company.

Neat volumes, good type, cloth binding, 50 cents each.

## Fireside Saints.

Mr. Caudle's Breakfast Talk, and Other Papers, by DOUGLAS JEROLD.

## The Wishing-Cap Papers.

By LEIGH HUNT.

## The Lover.

By RICHARD STEELE.

## Dreamthorpe.

By ALEXANDER SMITH.

"Nicht läuten darf die Abendglock' heut' Nacht."

"Curfew Must Not Ring To-Night."

(In German.)

Eine Ballade von ROSA HARTWICK THORPE, aus dem Amerikanischen überetzt von Hugo Erichsen, with all the original illustrations of the English reading. Cloth, full gilt, \$1.50.

## WHITE HOUSE Celebrities,

From Lady Washington to Mrs. Cleveland.

By LYDIA L. GORDON. Cloth, \$1.50.

## LIVES OF THE PRESIDENTS,

From Washington to Cleveland.

With Portraits. \$1.50.

## TRAVELERS AND OUTLAWS.

Episodes in American History, by THOMAS WENTWORTH HIGGINSON, with an appendix of authorities. Cloth, \$1.50.

## ANDERSONVILLE VIOLETS.

A Story of the War and After. By HERBERT W. COLLINGWOOD. Editor of the *Rural New Yorker*. Cloth, \$1.00. Paper, 50 cents.

## The Hidden Way Across the Thresh-old.

By J. C. STREET. New Edition. Cloth, \$3.50.

## A Modern Adam and Eve in a Garden.

By MISS DOUGLAS. 12mo, cloth, \$1.50. Uniform with

## The Douglas Novels.

12mo, cloth, 18 volumes, \$1.50 each.

## Manners; or, Happy Homes and Good Society all the Year Round.

By SARAH J. HALE. Cloth, \$1.75.

## The Reading Club, and Handy Speaker No. 19.

Edited by G. M. BAKER. Paper, 15 cents.

## NEW JUVENILES.

OLIVER OPTIC'S NEW "BLUE AND GRAY" SERIES.

First Volume—

## Taken by the Enemy.

Cloth, illustrated, \$1.50.

J. T. TROWBRIDGE'S NEW BOOKS.

## A Start in Life.

Illustrated, \$1.00.

PENN SHIRLEY'S NEW STORY.

## Little Miss Weezy's Brother.

By the author of "Little Miss Weezy." Cloth, illustrated, 75 cents.

## The Story Mother Nature Told Her Children.

By JANE ANDREWS, author of "Seven Little Sisters," etc. Cloth, illustrated, \$1.00; school edition, 50 cents, net.

## The Year's Best Days.

Stories and Poems for Young People. By ROSA HARTWICK THORPE, author of "Curfew Must Not Ring To-Night," etc. Cloth, illust., about \$1.00.

## Up the North Branch.

By CAPT. CHARLES A. J. FARRAR. Illustrated, \$1.25. CHRISTOPHER P. CRANCH'S STORIES.

A NEW EDITION.

## The Last of the Huggermuggers.

Illustrated, \$1.00.

## Kobboldoso.

A sequel to "The Last of the Huggermuggers." Profusely illustrated, \$1.00.

## The King of the Golden River.

By JOHN RUSKIN. Cloth, gilt, \$1.00.

## YULE-TIDE AND CHRISTMAS.

Christmas comes again with its Christmas trees and lights, its Christmas gifts and joys. The festive Yule-tide has been a holy season to our Teutonic ancestors since they came from Asia and settled in their northern homes in Europe, which their descendants, the Norwegians, the Danes, the Dutch, the English, and the Germans still inhabit. The dreariest days of the year, when darkness and frost with snow and ice were most oppressive, became by reaction as it were the most joyful time.

In the northern parts of Norway the sun disappeared entirely towards the close of December, and when after an absence of two nights or more it rose for a short time on the horizon, it was saluted with bonfires lit with yule-logs, with festive processions, with fir-trees illuminated with candles, with merry-making and family feasts of all kinds.

The mistletoe which grows on holy oak-trees and remains green in winter-time, whose seed was supposed to have fallen from heaven, was the sun-god Baldur's sacred plant. With mistletoe therefore the houses were decorated, and the greeting under the mistletoe was all love and friendship in the name of Odin's fairest and most righteous son. Baldur had been killed by the dark and gloomy Hoedir, but he was restored to life again. With Baldur all nature received new life, and all mankind rejoiced in him.

When Christianity was introduced, how could a better day for the celebration of Christ's nativity be selected than Baldur's festive day. The birthday of Jesus was not celebrated in the early church, and there is not even the faintest legendary account regarding its date. Our Teutonic ancestors succeeded in settling this problem in favor of their dear Yule-tide by a quotation from the scriptures. John the Baptist says as to his relation to Christ: "He must increase but I must decrease." (John iii. 30.) Accordingly, St. John's day was fixed upon the 24th of June when the days begin to decrease, and Christ's upon 25th of December when the days begin to increase again.

Yule-tide lost none of its charms when it was changed into Christmas. On the contrary, the sacred joys of *Weihnacht* gained in spiritual depth and importance, preserving all the while the old pagan ceremonies that symbolize the immortality of light and life.

Christmas is not a feast of any special creed. It had been celebrated as the pagan Yule-tide long before Christianity existed. The custom of celebrating it has spread from the Teutonic nations to France, and Spain, and Italy, and Ireland, and over the whole world. It is now the family feast of almost all mankind whether they believe in Jesus as their savior or not.

We keep the Christmas season as a dear and sacred time which in the midst of a dreary winter night reminds us of the sun's return. Darkness cannot conquer light, and death cannot conquer life. Christmas teaches us to bear up bravely in troubles, to keep up hope in misfortunes, to preserve the courage of life in the midst of struggles of cares and worries, and to spread joy around us so far as it is in our power. P. C.

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XI<sup>III</sup>.

### HEALTH AND DISEASE. (Continued.)

But while the moral characteristics of perfect health can often be studied only in the traditions of the past, our own age affords abundant facilities for the study of moral pathology. The most frequent psychic symptoms of impaired health are capriciousness and irritability. Despondency is by no means an invariable concomitant of disease. The brooding stupor of wounded savages often alternates with fits of bravado and reckless mirth, or even of facetious good humor, as in the remark of Sultan Baber's son, Mahmet, who in his exile had ventured to intrigue with the lady-love of a Tartar chieftain, and after being starved beyond the hope of recovery, was deprived of his eyes by order of the implacable emir. "I don't see what he wanted to blind me for," said the dying exile, "unless he was afraid that my good looks might interfere with the success of his amours in paradise."

Snorri Sturleson, in his *Heimskringla*, mentions the still stranger last words of a Norse warrior, whose breast-shield was pierced by an arrow, which could be extracted only by a series of desperate efforts, and at last proved to have torn out a piece of the wounded man's heart. "That's all right," grunted the expiring Baresark, after scrutinizing that sample of his interior

\* Copyrighted.

organism, "it's time I should be butchered anyhow, I'm getting fat to my very heart's root."

Fortitude of that sort, though, is inspired only by a strenuous concentration of mental energy, and no amount of habitual self-control is apt to resist the influence of lingering disease. Stoicism, indeed, requires a basis of physical stamina, and hospital experts cannot help confessing a good deal of skepticism concerning the alleged miracles of sickness-proof cheerfulness.

Chronic ill-humor is a product of effete civilization far oftener than of savage modes of life, and the traveler Kohl mentions the suggestive experience of a dragoon whose linguistic attainments had secured him the patronage of Syrian and Circassian chieftains, as well as of refined European travelers. "You must have come across perfect barbarians among those eastern customers of yours," said the professor, "and I suppose it's rather hard sometimes to put up with their bullying insolence?" "Well, yes," said the interpreter, "but I can tell you frankly that I could get along for a year with a Kurdistan robber-chief, more easily than for a week with a sick-tempered English aristocrat. Travelers of that sort may never use a coarse expression, and yet torment you with their meanness and their venomous tantrums (*'giftige Launen'*) till you would give a year's wages to have the privilege of thrashing them black and blue. They seem to be always trying to find fault, just for the sake of venting their bad humor; and the saints forgive me if the *lady-likest* women amongst them are not a dozen times worse than the men." Domestic servants cannot risk such comments, except, perhaps, under the circumstances which induced an American boarding-house keeper to profess religion and invite the prayers of her colored cook. "Just think of it, Dinah," she moaned, "I have been a sinner all my life, and I never knew it till yesterday." "Pshaw, madam," said Dinah, "I knew that all the time."

"Misery loves company," is a proverb that expresses one main cause of the irritable and almost vindictive humor accompanying many forms of physical complaints. The sufferer would seem to find a sort of solace in the success of his efforts to make others share his feeling of wretchedness, while on the other hand happiness dislikes the discord of distress and would wish to propitiate envy by making others equally happy—an impulse perhaps connected with the significance of the ancient belief that fortune's favorites must avert a change of luck by forgiving their enemies. "*Evasisti*" (you have escaped your fate), said the Emperor Trajan, on the day of his election, at sight of a man who had provoked him to a vow of mortal vengeance.

Tortured animals almost invariably become vindictive; a strychnine-poisoned wolf, in his last agony,

will snap savagely at his sympathizing friends who surround him with looks of surprise, and during the conflagration of a menagerie I once saw a badly scorched Moor baboon make a mad assault upon a helpless dog, who had for years shared the straw couch of his prison. Even sick horses are apt to use their teeth upon a companion whose sleek appearance aggravates their feeling of misery.

The disorders of the human organism betray an analogous tendency, and the apparent exceptions from that rule refer almost exclusively to *painless diseases*, such as certain affections of the respiratory organs, which in all but the last stage of the malady, evince their progress only in a feeling of general exhaustion. A two hours attack of gout or neuralgia, on the other hand, will sour the sweetest temper, and the sufferers from chronic bowel-complaints and bone cancers often become so fearfully peevish that none but well-paid attendants can be induced to endure their caprices. "Do, kill me at once," said a hospital steward of my acquaintance, "if a trouble of that sort ever should happen to get hold of me; I would rather be dead than be tempted to act like that snappish old demon over yonder."

It is a curious fact that a confident hope of recovery forms a distinctive symptom of certain fatal diseases. While dyspeptics, for instance, torment themselves with all the morbid fancies of Molière's *Malade imaginaire*, consumptives are very apt to underestimate their peril, and persist in explaining away the unmistakable symptoms of hopeless decline. In the last stage of their disorder that optimism, however, frequently collapses into the opposite extreme, and during the last few months of their struggle for existence the victims of pulmonary diseases often become fretful enough to make life a burden to their attendants, as well as to themselves.

"Have you ever known a patient to persevere his good humor to the end of a lingering disease?" I once asked an intelligent sick-nurse, who had for long years acted as chief matron of a large city hospital.

"Some of them hold out, by sheer will force, a good deal longer than others," said she, "but it seems to aggravate their misery, and, in fact, I have sometimes helped them to ease their melancholy by letting them growl away to their heart's content. Most of them, though, do not ask your permission, and they all break down sooner or later, women sooner than men as a rule, though I remember one case of a poor creature who had been hurt by a fall on her head, and was treated for cataleptic fits. She would get delirious and then lie as in a trance for days together, but in her lucid intervals she tried her best to make herself pleasant to everybody, poor soul, and seemed really to have a marvelous fund of good humor, unless she

was doing herself violence for fear of being sent to an insane asylum. Education is no guarantee at all against the absurdest fits of peevishness, and, indeed, I have often found that intelligent persons in such cases use their mental resources only for the purpose of making themselves more *ingeniously disagreeable* to nurses and doctors. A strong sense of justice is no safeguard either; I have known men of strict principles and a high sense of honor to get as unreasonably fretful as any hysteric woman. Their principles seem to slip away in such cases together with their physical hold on life, though it sometimes almost looks as if they thought it no more than fair that other people should be worried at least once in a while, while they themselves are in such constant misery."

The Mohammedan sect of the Sufis seek to establish communion with the spirit of the godhead by purging their minds of all worldly passion, and often renounce their earthly possession for the special purpose of avoiding the temptations of wealth and devoting themselves more exclusively to a life of spiritual meditations. The great mistake of the Christian ascetics consisted in the hope of enforcing that quietism by a system of health-destroying penances. There is a tradition of a Brahmin fanatic who dug out his own eyeballs, filled his ears with pitch, destroyed the nerves of his palate by the application of hot irons and at last lay down, "freed from the lusts of life and blunted to a sense of its evils," awaiting his final release in callous torpor. That utter suppression of vital instincts may have answered its purpose nearly as well as outright suicide, but as long as eyes see and nerves feel, persistent sin against the protest of their instinct is sure to avenge itself by all sorts of moral and mental, as well as physical, disorders. The self-torturing maniacs of the mediæval monasteries had to pay that full penalty of their crimes against nature, and instead of gaining the hoped for "peace of life-renouncing devotion," only succeeded in perverting the passions they attempted to suppress. There is, indeed, no doubt that morally and intellectually the victims of monachism degraded human nature far below the types of primitive savagery, and that the immoralities and cruelties of the culminating period of that millennium of madness are as unparalleled as the extravagance of its superstitions. "I would endure the rough justice of a penal prison rather than the petty chicanes of a French convent," writes a correspondent of Père Hyacinth; "of all the exasperating, spiteful, and low-minded tyrants on earth, a caprutulent abbot, in the exercise of his power for aggravating the miseries of a miserable existence, is decidedly the worst."

The testimony of thousands of refugee monks and nuns has confirmed that verdict, and there is no

greater mistake than the mediæval belief in the possibility of freeing men from their vices by depriving them of their health. It would, indeed, be difficult to name a single moral or mental aberration which in some of its forms does not constitute a symptom of impaired physical health. Suffering undermines the basis of common sense and common justice; principles of rectitude "slip away" with their physical concomitants; the purely physical misery of alcoholism will tempt its victims to purchase relief by any sacrifice of personal honor. "Sensual excesses," says Ludwig Boerne, "are the consequence, as often as the cause, of disease," and it is equally true that nervous disorders may engender a love of cruelty for its own sake. An ultra-brutal delight in the infliction of pain is a well-known symptom of certain brain-diseases, and few pathologists would be inclined to doubt that moral aberrations such as those of Phalaris, Nero, Caligula, Pedro of Aragon, Czar Iwan, and Chevalier Retz, must be considered a consequence of physical disorders.

The physiological *rationale* of such consequences, must, however, often remain a matter of mere conjecture. We may trace the fretfulness of dyspeptics to the intimate connection of the brain with the gastric branch of nerves, but no anatomist could venture to explain the curious, and yet undisputable, fact that blind men are nearly always remarkably trustful, even under circumstances not apt to justify a confiding disposition, while deaf and dumb persons, with as rare exceptions, are extremely cautious and very prompt to resent an abuse of their confidence. Nor would it be easy to explain the morbid activity which often characterizes the delirium of nervous disorders, as if its victims were stimulated by the desire of utilizing their last scant resources of vital strength, while consumptives, with all their optimism, are apt to become morbidly averse to every kind of mental or physical effort

(To be continued.)

#### FORM AND FORMAL THOUGHT.

##### IV.

#### THE BASIS OF THE ECONOMY OF THOUGHT.

Mathematics, as still taught in our schools, is, after the example of Euclid, unfortunately constructed on axioms. The introduction of axioms still gives to mathematics an air of mysteriousness which should be absent in this most reliable and well established science. This doctrinal method of teaching mathematics, by starting from authoritative axioms, which have to be accepted on good faith, is unphilosophical and should give place to a more rational method. It induced Schopenhauer to declare that the whole science, being based upon non-proven truths, remains non-proven. He considers mathematical certainty to be ultimately a part of intuition and thus reaches a point where mysticism can have full play.

Hermann Grassmann in his "theory of extension" (*Ausdehnungslehre*) avoids the faults of Euclid's method. Grassmann throws a new light upon Kant's idea of the a priori by formulating a science of pure mathematics. Our space has three dimensions (*Ausdehnungen*, or extensions), and plane geometry is a mathematics of two dimensions. Grassmann's idea was, to propound mathematics as it would appear if absolutely abstracted from dimensions of any number. This science of pure mathematics must be the most abstract formal thought.\*

The "theory of forms in general" (*Allgemeine Formellehre*), Grassmann says, should precede all the special branches of mathematics. By a theory of forms in general he understands "that series of truths which refers equally to all branches of mathematics and which presupposes only the general concepts of identity and difference, of combination and separation. \* \* Products of thought can originate in two ways, either by a simple creative act (that of positing) or by the double act of positing and combining. The product of the former kind is a constant form or magnitude in a narrower sense, that of the latter kind is a discrete form or a form of combination."

On the concepts of the identity and difference of posited acts of thought by mere combination and separation, Grassmann builds his magnificent structure of a theory of forms in general, of which arithmetic, geometry, algebra, mechanics, phoronomics, and logic appear to be applications only of special kinds. He is in need of no axioms whatever. The only postulates are such as these: Arithmetic is a system of first degree; plane geometry is a system of second degree; and space is a system of third degree. Plane geometry has two dimensions, and, therefore, if we have one point fixed, two magnitudes are required for the determination of any other point. Space has three dimensions, so that taking a fixed point three magnitudes are necessary for the determining of any other point. Colors, it appears, are another system of third degree; they can be reduced to three primary colors: red, orange, and blue. Accordingly three magnitudes are required for determining any kind of tint. A distinguished scientist has invented a method of graphic representation of colors by triangles.

\*The ingenious attempts of Bolyai and the Russian geometer Lobatschewsky (discussed in C. F. Gauss's "Briefwechsel mit Schumacher," Vol. II, pp. 268 to 271), to erect a geometrical system which would be independent of the Euclidean axioms in regard to parallels, and Riemann's meritorious essay "On The Hypotheses Of Geometry," have called the attention of mathematicians and scientists to a remarkable problem which finds its natural and most simple solution in Grassmann's theory of pure mathematics. Hamilton's method of Quaternions is contained in it also, since Grassmann takes into account the length and direction of lines. For brief information on the subject see Helmholtz's lucid sketch *Ueber die Thatsache, die der Geometrie an Grunde liegen* (Upon the Facts that lie at the Basis of Geometry), J. B. Stallo, "The Concepts and Theories of Modern Physics," pp. 208 seqq., and 218 seqq., and compare also with Hermann Grassmann: *Ausdehnungslehre, Anhang I.* and III. pp. 273 seqq., and 277 seqq.

We cannot have any intuitive conception of a space having four dimensions. Nevertheless, pure mathematics, being independent of dimensions, applies just as much to systems of four and more degrees as to the actual space of three dimensions. The regularity of every system is fixed a priori by the elements posited for that system. The elements, positing themselves or being posited by us according to the rigid rule of strict consistency, will necessarily form a regular and orderly arranged system. We can therefore state with absolute precision all the formal laws by which bodies of four or five dimensions, if they existed, would be governed.\*

The chief difference between the numbers of arithmetic, geometrical planes, mathematical space, on the one hand, and Grassmann's systems of 1, 2, 3, or  $n$  dimensions on the other, is, that numbers, planes, and actual space are accepted as given; they are the data of arithmetic, geometry, and mathematics, while the systems constructed by Grassmann's "theory of forms in general" are conceived as products of thought. They are posited by a progress of thought and can be considered as data only if their parts, once posited, are further used as such for combinations among themselves.

It is obvious that the only condition of all kinds of such systems of formal thought is *consistency*. Truth with regard to our knowledge of reality is the agreement of our concepts with the objects represented; but truth in the domain of pure formal thought is the agreement of all posited forms of one and the same system among each other. This consistency is the

\*As an example we may use the instance, that the product of two magnitudes in a system of second degree can be algebraically expressed by

$$(a + b)^2 = a^2 + 2ab + b^2,$$

in a system of third degree, by

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3$$

in a system of fourth degree, by

$$(a + b)^4 = a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4.$$

Accordingly, a cube or any parallelepipedon which is the product of two magnitudes consists of eight tri-dimensional parts. This fact cannot only be proven a priori by mathematical or algebraical demonstration of purely formal thought, it can be ascertained by experience also. A cube that is cut in all its three dimensions, according to the ratio of  $a + b$ , will afford an example, and a body formed by two magnitudes  $(a + b)$  in four dimensions, if it were possible, would consist of the following 16 four-dimensional parts:

1. A regular body which in all four directions measures  $a$  ( $= a^4$ ).
2. Another regular body which in all four directions measures  $b$  ( $= b^4$ ).
3. Four bodies which in three dimensions measure  $a$  ( $= a^3$ ), and in one  $b$ .
4. Four bodies which in three dimensions measure  $b$  ( $= b^3$ ), and in one  $a$ .
- 5) Six bodies which in two dimensions measure  $a$  ( $= a^2$ ), and in two  $b$  ( $= b^2$ ).

basis of all law, regularity, and order; and whatever system of forms may be selected, its rules and theorems will be developed by our mind with the same wonderful harmony and precision as can be observed in mathematics, arithmetic, logic, and mechanics. Accordingly, if the world were otherwise than it is, if space had only two, or if it had four dimensions, the laws of the world would be otherwise, but none the less regular than at present—they would be strictly *gesetzmässig*, i. e., conforming to, and explainable by, law.

Consistency must be considered in the empire of form as the counterpart of inertia\* in the realm of matter. So long as nothing interferes to produce a change, everything will remain as it is. Consistency therefore, the very root of order, from which all order of form in every possible system of forms finds its explanation, is the natural state. Consistency like the law of inertia and the law of identity explains itself. Wherever we meet with it, it need not be accounted for; an explanation becomes necessary only where consistency is lacking. From this consideration it is apparent that to whatever system the form of reality belonged, it could in no case be devoid of order. The world could not be a chaos, but of necessity must be a cosmos.

Grassmann's theory of 'forms in general' throws a new light upon Kant's doctrine of the *a priori*, since it exhibits a science of pure form in its most generalized abstractness. Thus the *a priori* has lost the last vestige of mystery and we can easily understand how the cosmical order is due to the formal laws of nature. While Kant's reasoning has been correct in the main, it is apparent that real space is not quite so purely formal as he imagined. A system of form of the third degree can be posited *a priori* by formal thought; but the fact that real space is such a system of the third degree can be ascertained by experience only.

We have used the word order in the sense of objective regularity which of necessity results from a consistency of form throughout one and the same system. This regularity of forms enables us to think many samenesses by one idea and thus makes an economy of thought possible, which as Ernst Mach declares is the characteristic feature of science. Ernst Mach (who I must suppose has attained to his ideas quite independently of Grassmann, although there is no doubt that both have been strongly influenced by Kant), points out, by a happy instinct as it were, the most practical application of the theory of formal thought in general.

The regularity of form being repeated in the physiological arrangement of the nervous cells and fibres

in our brain, produces in man an economy of feeling and thinking which the more it is realized and practiced, gives him the greater power over nature.

## V.

## CONCLUSION.

Although Kant's Transcendental Idealism cannot be considered as a final solution of the basic problem of philosophy, it nevertheless pursues the right method and has thus actually led us to a solution which, we hope, will in time be recognized as final. In Kant's time, it seemed as if the key to the mysteries of cosmic order should be sought for in nature's manifestations outside of the human mind. Kant, a second Copernicus, reversed the whole situation and pointed out that the key to the problem: "How is nature possible at all?" is to be found in the human mind. And yet the natural sciences, inquiring into the secrets of nature by the observation of natural phenomena, were after all not on a wrong track. Kant and the natural sciences seemed to exclude each other, but they were complementary. Schiller who in so many respects fore-told and fore-told future events in the prophetic spirit of his poetry, said in one of his Xenions, inscribed "Transcendental Philosophy and Natural Science":

"Both have to travel their ways, though the one should not know of the other.  
Each one must wander on straight, and in the end they will meet."

Two truths may at first appear contradictory, though they are not. Let us not distort the one for the sake of the other, but let each be presented without regard to the other, and let every point of divergence be brought out fully. Theory and practice, formal thought and experience, the thinker and observer, will at last agree better if they boldly take the consequences of their views and combat those of the other. About the relation of transcendental philosophy to natural science in his time, Schiller said:

"Enmity be between both, your alliance would not be in time yet.  
Though you may separate now, Truth will be found by your search."

There has been enmity enough between philosophy and natural science. Philosophers looked with scorn upon the specialists who confined their labors to narrow circles, and scientists, confident of their positive results, smiled about the phantastic dreams of theoretic speculations. However, in the progress of time, philosophers learned to prize the valuable researches of natural science, and the scientists felt the necessity of a philosophical basis for their investigations and methods of investigation. At present the want of a close contest between philosophy and the sciences is a fact that is freely acknowledged by both, philosophers and scientists.

In Kant's and in Schiller's time an alliance between philosophy and natural science would have been premature. How many futile attempts have been made

\*Inertia in German is sometimes called *Trägheit*, sometimes *Beharrung*. *Trägheit* is the literal translation of inertia; it is a negative term which denotes the non-appearance of new energy, or motion, or activity. *Beharrung* is the better term; it affords a positive expression for "inertia," denoting the unchanged continuance of the energy in existence.

in the mean time! Fichte, Schelling, Hegel, and Schopenhauer in Germany, the two Mills and Herbert Spencer in England, Auguste Comte in France, have appeared with their systems, partly opposing, partly repeating Kantian ideas in other and original ways of presentation, partly combating his very method, partly popularizing, and at the same time opposing his views. But none of them (not even Comte\*) succeeded in creating a well-established positivism that could dispense with the mystical element altogether, whether it appear as the Transcendental, the Unknowable, or the Supernatural.

We have attempted in these essays on "Form and Formal Thought" to lay the cornerstone of such positivism, which, it is to be hoped, will prove to be the only true Monism, *i. e.*, a philosophy free from contradictions and in accordance with reality, thus offering a basis for a unitary and harmonious conception of the world.

P. C.

### THE ATTACK ON ROBERT ELSMERE.

BY WM. M. SALTER.

The attack of the pulpit on *Robert Elsmere* is almost as significant as the book itself.† The attempt is made to depreciate the book. It is not a great work, we are told, and it is Mr. Gladstone who has given it publicity—though where Mr. Gladstone's labored review has been read by tens, it is safe to say, that the novel has been read by hundreds or thousands. It is called, "a passing pamphlet advocating a transitory theological whim." How strange that other pamphlets advocating "transitory theological whims" have almost no readers! Its sinister purpose is pointed out; it is "a subtle, powerful, perilous attack," "an attempt to discredit the old, old story," it aims "to undermine faith in the testimony by which the New Testament miracles are supported." But cannot an artist relate a wonderful and yet not uncommon spiritual experience without a polemical motive? When George Eliot gave the world her beautiful picture of Dinah, was she an advocate of Methodism? Yet, even if Mrs. Ward's motive was priggish, to hold up a model for her readers, there is not in the whole of *Elsmere's* career one trace of hostility to Christianity, nor could one learn from him any other desire than to retain as much of Christianity as it is intellectually possible to retain. Objection is made that the author does not present the argument for the divinity of Christ, the reality of the resurrection and miracles; but why should she, when she makes no pretense of writing a controversial treatise—and when, it might be added, the argument is already so well-known?

As the book is misinterpreted, so is *Elsmere* himself belittled. His early belief is called a "feeble product of religious emotions"; nor did he find himself compelled to abandon it as the result of the gradual processes of his own thinking, but the Squire "demolished" it; his mind, we are told, had pinned "itself on to Squire Wendover"; he made a good fight for his wife, but scarcely any for his religion. The charges even descend, I am ashamed to say it, to vulgarity.

\* Except for the living in it, one cannot conceive of Robert Elsmere going into the ministry," one minister remarks; he speaks of

\* Comte believed in the Unknowability of what he called "first and final causes," and considered only "the middle between them" accessible to cognition. He attempted to limit science to the positively knowable, but in so doing he left a non-knowable; he did not succeed in entirely freeing himself from mysticism—which after all is the primary object of all philosophy.

† I refer to the sermons of two distinguished representatives of the Chicago pulpit—one a Congregationalist, the other a Presbyterian—reported in the Chicago morning papers of the 22d and 29th of October, 1888.

Robert's "theatrical struggle," and says, with unction, "Christ came to save sinners and not to provide refined entertainment for such men as Elsmere." I ask any one who has read the book whether this is a true picture of *Elsmere*, whether for one moment he can be thought of as a dilettante? Yes, *Elsmere's* struggle is made ridiculous. He made, it is said, tremendous effort to give up something he never possessed; a minister of the Christian religion, he never knew what it was to be a Christian. What is meant by this? Simply that he never knew Evangelical Christianity,—and Evangelical Christianity by a well-nigh inconceivable narrowness is represented to be the only type of Christianity which there is any great significance in breaking with. Because Mr. Moody's Christianity, and Mr. Spurgeon's, and that of the Armour mission is not taken as the type of that which *Elsmere* unlearned, therefore the latter is of slight account. Moody, we are told, could not have been stirred by the arguments which wrecked *Elsmere*. I grant it. Moody stands like a rock whom modern ideas beat upon in vain. In answer to those who say to him, "You don't believe the story of Noah and the flood!" he answers "I believe it as implicitly as I do the Sermon on the Mount." To those who bring up Jonah and the whale, "Oh, yes!" he replies; "I believe that just as much as I believe the resurrection of Jesus Christ,"—and to those who urge that a whale cannot swallow a man because its throat isn't large enough, he answers all undismayed that God could attend to that difficulty, that He would have no trouble in making a fish large enough to swallow Jonah. I do not quote these words of Mr. Moody's to discredit him. Rather do I find something refreshing in his imperturbable manner—and that he loves his fellowmen and with his whole heart tries to help them, I make no doubt. But would we have had Mrs. Ward take his type of Christianity as the type from which *Elsmere* should fall away—or, what is perhaps about the same, Mr. Spurgeon's or that of the Armour mission? In all candor I ask, Would such a type have had sufficient intellectual significance? Would profoundly thinking men and women, would students and scholars, would the lights of our Chicago pulpit themselves have cared to read the book framed on such a basis?

It should perhaps be remembered that the book was not written in Chicago, but in England, and that the most commanding religious faith there, and the ripest culture, are not in Presbyterianism or the Baptist persuasion, or in mission chapels, but in the old historic church of England. If Mrs. Ward had taken her hero from one of the Evangelical sects, or from what is known as the Evangelical party in the church of England, would not large numbers of people have said over there, and not a few here, "Ah, but she did not give us a specimen of the highest and most attractive Christianity to begin with, and what we should like most to know is, how a broad and cultivated and genial believer like Kingsley or Maurice could have been led to give up his faith?"

It is charged that no genial representative of modern orthodoxy is to be found in the book; but *Elsmere* himself is such a representative, so far as a young man can be. Neither a High-churchman nor a Low, he yet conceived of the English church as a great national institution for the promotion of God's work on earth, and none, we are told by the author, who came near to him could mistake the fervor and passion of his Christian feeling. With "prayer and self-abasement" he vowed himself to the ministry of the church. At Oxford he came into contact with skepticism, both on its philosophical and on its historical side; he became presumably familiar with the works of Mill and Herbert Spencer, and failed to be satisfied with them, like other ardent young men in Oxford at that time. Though one of our ministers says he had no thorough or even respectable training in the evidences of Christianity, he doubtless had what Oxford afforded—and it is not improbable that that ancient and honorable institution of learning afforded as much as could be found anywhere else in Europe, unless it be at Leipzig or Berlin; yes, we are expressly told that he was familiar with apolo-

getic arguments and used them with ability and ingenuity, and that in reply to Langham, who urged that Christianity was simply made up of ideas personified, he declared with warmth that the ideas had been realized, made manifest in facts. Without being a philosopher or profoundly original in any direction, yet open-minded, noble-hearted, deeply in earnest, he was, on leaving Oxford and taking up his country living, a fair representative of the best tendencies, the broadest culture, the finest and purest temper in the English church. The very interest and power of the book, yes, the fatal charm about it so much regretted by our ministers, is that a specimen of the noblest and manliest Christianity of our era is taken for its hero, and that just such an one as he is involved in the ensuing tragic experiences.

The clergymen who have attacked Elsmere do not really understand him, do not appreciate the real meaning of his experience. We understand what we are, some one has said—what we have gone through in our own soul. Christian ministers often apply this truth to those who make heartless and frivolous attacks on Christianity. It does not seem to occur to some of them that it may be necessary to apply it to themselves in their judgments on so delicately-strung a nature as Elsmere's. Have they ever been in his place? True, one of our ministers says that Elsmere's experiences have been those of almost every man of note in the American pulpit to-day, at some period or other of his career; but he surely, and his brother-minister, who has made a somewhat similar though less offensive, attack, are among those men of note, and since they are young, would more likely have known something of Elsmere's experience than older men, and yet they give no signs of ever having passed through it.

The doubt that assailed Elsmere was of a peculiar character, and he met it in a peculiar way. It was not of his own will that he doubted. He had no wish to disbelieve. All his wishes were to believe. All his emotions were on the side of Christianity. His faith was a part of his whole make-up as a man. "It isn't as if we differed slightly," he said to the Squire in the early part of his acquaintance with him; "we differ fundamentally, is it not so? I am a Christian, I believe in an Incarnation, a Resurrection, and Revelation." When his doubts came, they were totally unlike those of Voltaire, or Paine, or of many popular liberal lecturers, whose doubts seem, in a measure, part of their *animus* against the church. Nor did his mental unrest come from abstract arguments. Our ministers argue against him that miracles are not impossible. He never denied or questioned this. They say he adopted a philosophy of history and nature which forbade him to believe in miracles. But philosophy had little or nothing to do with his change. Grey had such a philosophy,—but, as is patent to those who do not jumble diverse things together, and as Grey himself distinctly says, Elsmere's mental development was on a totally different line. The complete failure of our ministers to so much as apprehend Elsmere's distinctive point of view is shown in their saying after Mr. Gladstone that while he follows the Squire in giving up the miracles, he does not, "for reasons unexplained," follow him in giving up theism. This would be indeed strange if, as is charged, Elsmere's mind had pinned itself on to the Squire; if he were simply the feeble dupe of Wendover's logic, it would be simply incomprehensible that he should not yield in both respects; yes, the fact that he did not, is the *reductio ad absurdum* of that charge and confirms the truth of Robert's words to his wife in relation to the Squire: "It was not his doing in any true sense. I am not such a weak shuttle-cock as that," though he allows the Squire's influence upon him and admits that it hastened everything.\* And why should Elsmere, because he ultimately gave up miracles, give up theism too? Why, unless in the mind of the objectors there is some connection between the two things? Why, unless they suppose that the same logic that is averse to miracles is averse to faith in God

also? But in this they show that they do not understand the logic of Elsmere's distrust in miracles, since one may feel it and yet have, and have a right to have, as much faith in God as ever.

The point is that a man's faith in God, if it is a logical faith, rests on philosophical foundations, while Elsmere's distrust of miracles rested purely on an historical basis. God, in the philosophic idea of Him, is not something that happens, but the First Principle of things; but a miracle, if it is real, is something that happens, and the same canons of historical investigation, that apply to all the events of the world's history, apply to it. The question of miracles—and it is the question of orthodox Christianity—is not a question of whether God exists or whether he acts in the world, but whether he acts in a peculiar and exceptional manner—in other words, whether certain extraordinary phenomena have taken place. Evidently, it is a question for trained historical students. One might admit and deeply feel that Christianity has done great good in the world, and is still doing it, one might be at loss to know what could take the place of it, one might be most reverently and affectionately attached to it, one might feel that so far as abstract argument goes nothing can be successfully said against it, one might even in a moment of despondency take comfort in the "thousand Christian colleges of the world and its four hundred thousand pulpits, which give no sign of being silenced," and feel edified by the statement that "miracles are the jewels which naturally adorn the brow of the celestial King"—and yet all this give little help to him in answering the simple, plain question, Did the miracles truly and really happen?

Now Robert's chosen line of study was history. He took it up with that fine and noble enthusiasm characteristic of him, little dreaming what fruits it would ultimately bear. He even planned a book, and, as it chanced, his researches took him into the early mediæval period when miracles were rife and were reported with the utmost good faith. One day he read a narrative by a Bishop in Southern France to Catherine. Her work dropped a moment on to her knee. "What extraordinary superstition!" she said, startled. "A bishop, Robert, and an educated man?" Robert nodded. "But it is the whole habit of mind," he said half to himself, staring into the fire, "that is so astounding. No one escapes it."† It was these hours and months of quiet study, before he even came into friendly relations with Wendover, that all unconsciously prepared the way for the bitter struggles that should come later. At first, no doubt, it never seriously occurred to him that the gospel miracles might be in the same category with the mediæval ones; to him, as to our ministers to-day, there was a plain line of demarcation between the "dubious miracles" which Romanism vouches for, and the miracles of the New Testament for which the evidence is so "massive and complete." But at last, and through the instrumentality of the Squire—though essentially the same thing would have happened sooner or later, in any case—the whole problem in his bearing on his personal faith was brought home to him. From the hints that the author gives us—and they are of course only hints, not detailed statements, as they might have been if her book had been instead of a novel the intellectual biography of one man—and yet hints that to trained theological scholars should be almost as good as complete statements, we gather that the multifarious questions relating to the ideas and mental habits of the Jewish people in the time of Jesus, the extent to which he shared in them, the origin of the gospels, their historical trustworthiness, and the testimony of Paul, were turned over in his mind. Or rather we may say that at the time of his noteworthy conversation with the Squire on that April day, he was already familiar with these questions; for the ideas, impressions and arguments bred in

\* Chapter xx.

† In this opinion, I am confirmed by articles in the *Andover Review* for September and the *Atlantic Monthly* for November.

him by his historical work,\* we are told crippled his power of resistance to the relentless sceptic, and the question after all, in its ultimate form, was simply whether the age of Jesus was so different from other ages, and the narrators of his miracles so much more like what competent, trustworthy reporters of such events should be, that these miracles are to be credited, and the others not. Robert knew—that is, he knew with his critically-trained intellect—that this was not the case; but it is another thing to practically adopt a conclusion, and for "three miserable months," we are told, he vainly, helplessly fought with his fate, his mind torn, his heart sore, living through that bitter struggle, which a sort of Mephistophelean sarcasm taking for a moment the tone of a Christian minister ventures to call "theatrical."

We are told that if Catherine had been more sympathetic, she might have helped him. Yes, she might—might a little, that is; for a true man's faith is a part of himself and the pain of losing it, no other person can totally assuage. But this is not the help meant. What is meant is that she might have prevented his theology from going awry, that a good and sympathetic Christian wife would have been better than evidences, arguments, sciences, facts, or books. A woman's love and sympathy are of priceless value to a man; but can they twist his intellect, can they keep him from seeing straight, can they dictate his solution of a scientific problem? What a perverse misuse of the sweetest treasure a man can have! How weak-minded in a man to allow such influence, and how much nobler a compliment to woman to imagine that she can be a searcher for truth with her husband, his intellectual companion, not enslaver, that she too can walk into darkness and the night with him and believe in the day beyond, yes, can in the darkness make light from the still fire of her love!

But no, Elsmere had to fight out his weary and wearying battle by himself; in this struggle which was more moral than intellectual, those clear but passionless and, one might almost say, conscienceless souls, Wendover and Langham—"souls at war" as Mrs Ward says, "with life and man, without holiness, without perfume"—men who stood in a certain narrow way for liberal ideas, but are of a type so repelling that the only effect of the book so far can be to make liberalism detestable—they, Elsmere felt, could give him no help; and so he turned to Grey, and to him not so much for light, as for approval, for advice as to a practical problem of duty.† He had himself felt that he must give up his living and his orders,‡ and after he had unburdened himself to this wide-browed man, who along with the intellect of a philosopher had the heart of a saint, and met with his approval, there was nothing for Elsmere but to cast the die; his career in the church came to an end.

The question may be considered in closing: Is there a difference between the miracles of the church and the miracles recorded in the gospel? One of the critics of Mrs. Ward's novel thinks there is a difference between an isolated portent, recorded in some mediæval or earlier chronicle by some one who heard that such and such a thing occurred or who claimed to have seen it, and the New Testament miracles in favor of which gathers such a combination, such a steel-linked net of weighty probabilities, arguments, evidences concurrent, in dependent, supporting, confirming, and conclusive, as has been shown over and over again. Plainly there would be a difference if such were a fair statement of the case. But what are the facts?

Leccky tells us that the writings of the Fathers contain numerous accounts of miracles which they alleged to have taken place in their own day and under their own notice. § Justin Martyr, who wrote in the second century distinctly asserts the continuance of

miracles in his time. The fact is, that if we trust to testimony, miracles became more and more numerous, more universal, more extraordinary, as the centuries went on. Let us take a special instance. The good and great Augustine solemnly asserts that in his own diocese of Hippo, in the space of two years, no less than seventy miracles had been wrought by the body of St. Stephen, and that in the neighboring province of Calama, where the relic had previously been, the number was incomparably greater. He gives a catalogue of what he deems undoubted miracles, which he says he had selected from a multitude so great, that volumes would be required to relate them all—and in that catalogue we find no less than five cases of restoration of life to the dead.\* It is impossible to question Augustine's veracity. The only question is, had he critical habits of mind? Was he not only a profound thinker, but an accurate observer? In these cases, did he observe at all? Apparently, he does not say so. Miracles were, perhaps, scarcely more improbable to him than the ordinary events of life and nature, and he credited them as reported, though he plainly used discrimination, as any sober man would in crediting ordinary occurrences.

The question is then, do we know that the writers of the gospels had critical habits which Augustine may have lacked? Was their age more scientific? Were they themselves accurate observers, or, in the case of the miracles they record, do they claim to have observed at all? If they were honest men,—and of that I for one make no question,—and were eye-witnesses and could not have been mistaken, I should credit their narratives as I should any other competent historical testimony. What is the fact? First, as to critical habits of thought among the people to whom they belonged; it was the common notion, to take but one instance, that certain nervous diseases were caused by indwelling evil spirits. Second, the gospel writers do not even claim to have observed the events they narrate; they describe miracles, but do not say *they* saw them. From the gospels themselves, we should not even know who their authors were, save possibly the fourth, about the historical worth of which it seems impossible for scholars to agree. The author of the third gospel especially disclaims being an eye-witness, nor does he say that any of the numerous gospels that were in existence when he wrote, were composed by eye-witnesses. So far as we have any light at all upon the origin of the first two gospels, it is from the second century†—and this only makes plain that the writer of our first gospel in its present form was not Matthew, and that the writer of the second in its present form is unlikely to have been Mark. In fact, the accounts are all second-hand, save by a bare possibility that of the fourth gospel; all we can say with any tolerable degree of confidence is that they represent the traditions of Jesus that were current in the second or third generation after he died. If we single out the resurrection,—the evidence for which one of the clergymen I have referred to, said on another occasion was stronger than that for the assassination of Julius Cæsar, and the death at St. Helena of Napoleon Bonaparte—we find that we have no direct testimony in its favor from one of the original twelve apostles, unless, as I have said by a bare possibility, it be John. It is supposed that we have epistles from Peter, James, and Jude—but none of them says that *he* saw the risen Jesus. There are plenty of statements that "he was seen," none that "I saw him."

Yes, there is one exception. It is that of Paul. Paul had never seen Jesus in the flesh, but in a vision he believed that Jesus had been revealed to him. No one can fail to admire the ardor, the heroism, yes, the profound intellectual qualities of this great reformer and propagandist. Of him we know more, of his personality we can form a more vivid and detailed conception, than of any other early Christian disciple, than even of Jesus himself. Of Jesus we know only indirectly; Paul lays bare his mind and his

† I refer to the testimony of Papias as quoted in Euseb. Eccles. Hist. iii, 39.

heart in his own epistles—for there are four undoubted ones. But was Paul of a critical habit of mind? Suppose you had an acquaintance who thought he had special revelations from heaven, who undertook journeys at (as he thought) supernatural instigation, who was not infrequently in a state of trance in which he saw Christ and had conversations with him, who occasionally fell into a state of ecstasy in which he could not tell whether he was in the body or out of it, should you be able to absolutely confide in him if he said to you some day that he had seen a man who, you knew, had died? Should you call him a reliable witness, however pure and good he might be, and however deep a thinker in other directions? Unless you were a Spiritualist, I much suspect you would think him to be off his balance. Yet this picture of a hypothetical acquaintance I have drawn from Paul's own statements about himself.

It was in a revelation that Paul saw the risen Jesus—revelation is the very word he uses to describe that wonderful experience; and what is more significant still, the revelation to him is the same in kind as those which he credited to the other disciples; so that, so far as his evidence goes, all the early disciples who saw Jesus after his death were men of this type,—that is, given to visions and revelations. It needs hardly to be stated that one's interpretation of these phenomena will depend more or less on one's interpretation of the phenomena of what is now called Spiritualism; though, if the Spiritualistic theory is true, there was no miracle about the resurrection of Jesus, and Jesus is no more thereby proved to have had a Divine mission, as the church has always triumphantly thought, than the last poor mortal who has been laid to rest and then has seemed to rise again. The fact is that when we earnestly ask for the positive evidence in behalf of the gospel miracles, it is either of a nature so second-hand, or otherwise so dubious, that it is scarcely possible unless we are Spiritualists, to base a confident belief upon it. We are not thereby led to say that the New Testament writers were "fools or else deceivers," or, to use another vigorous and rigorous form of expression, either "simpletons or frauds," any more than we are obliged to call St. Augustine either a simpleton or a fraud, or to call Sir Matthew Hale an imbecile or credulous enthusiast, because he believed in the reality of witchcraft, and sentenced two poor witches to be hanged, saying that he was fully satisfied with the verdict; we are not obliged to any more than we are obliged to call Spiritualists to-day "simpletons or frauds." A man may be mistaken without being either. "A man of veracity, judgment, and mental power," like England's Chief Justice in the time of Charles the Second, just referred to, may go sadly astray in one direction simply because of the presuppositions his mind worked on. Credulity itself is a relative term and what would be credulous to one living in the nineteenth century would not be to one living in the intellectual atmosphere of the seventeenth, not to say the second or the first. All that we are obliged to say is, that the miracles of the gospels, like others that we hear of, like witchcraft and demoniacal possession, are things in the air, that while those who want to believe in them can evidently do so, those who want simply to know the truth may be unable to find any ground for a confident opinion—in other words may be obliged to give them up as a part of their religious faith.

No manly soul will join in the whine that this is merely a negative result. Has it come to this—that men and women will not acknowledge a truth because it is called negative, and the argument for it analytical rather than synthetical? Men and women to-day are not children, and if a thing is in the air, which they had supposed to be solid fact, they want to become aware of it. I affirm that the heart of religion is untouched by abandoning all that Elsmere gave up; I join with that noble-minded Christian minister of New York, Heber Newton, in saying that Elsmere lost a religion and found religion. The pathetic thing is that our ordinary train-

ing has so identified religion with miracles, with tales of incarnation, revelation, resurrection, ascension, that we can hardly recognize it without them, that its deep and sublime meaning apart from them is hardly realized, yes, that in consequence many honest, sturdy men who will not have anything that cannot stand the light of day, are giving up religion altogether. Voices made themselves heard in France before the revolution, protesting against the narrowness of the old ecclesiastical ideas. *Elargissez Dieu*, they said. So we might say to-day, *Elargissez la Religion!* Take off the bands, let it grow, let it become as large as the best thought, the noblest conscience, the broadest sympathies of the time. I for one want a religion that will bind all good men together, whatever their theories or philosophies—bind them together in unselfish love, and in an ideal enthusiasm, bind them together in a holy war on all that is base, on all that is cruel and unjust, bind them together to make bad men good and good men better, bind them together in reverence for the past, in courage for the present and faith for the future, bind workingmen and employers together, bind each to all and all to each. Religion—yes, it is that which binds one; only let us be bound by the best and not by that which may narrow us and prove a burden too great to be born. It was in this direction, whatever his limitations, that Elsmere—that eager spirit who struggled so bravely and spent himself so soon—was tending; and it is in this direction that a man may go feeling that he is not merely following a device of his own, but co-operating with the best tendencies of the time, fulfilling one of those various tasks which the Spirit of the wide World, in the successive ages of human history, commits to men. And as I think of Elsmere wasting away in Algiers and sinking into untroubled sleep at last, there come to my mind those pathetic and yet ringing words of Eichendorff, which I cannot attempt to translate:

"Wo immer müde Fechter  
Sinken im müßigen Strauss,  
Es kommen frische Geschlechter  
Und fechten es ehrlich aus."

## SONNET.

BY LOUIS BELKOE, JR.

I send the roses that I love to-day,  
The pale ones and dark red. I've found them here  
Like those of France, and send them with sincere  
Well-wishes and the word I dare not say.

They're fresh and perfect now, but if delay  
Should give them time to wither, as I fear,  
Accept them from me as they now appear,  
Remembering they've been long upon the way.

Remembering that my fairest thoughts, expressed  
In terms of little worth, for lack of art,  
Must reach you withered flowers, at the best.

Remembering that the purer, nobler part  
Of all I feel must fade within my breast;  
The way's so long between my lips and heart.

## JOB'S PRAYER.

BY CLINTON COLLINS.

Teach me, O Lord, to know,  
That beyond the clouds, however dark they be,  
There is blue sky.  
That, however threatening low those clouds  
May hang,  
The wind may break and sweep them by.

Teach me, O Lord, to know,  
That day is sure to follow e'en the darkest  
night.  
That Work is the Sun which puts the  
darkness into flight.  
Teach me, O Lord, to know what Work is,  
Not strivings after riches, power and  
fame, the livelong day,  
But patient endeavor to mould and  
Shape the spirit from the clay.

### THREE MOTHER SONGS.

From *L. Prang's Baby's Lullaby Book*.

#### I. THE LULLABY.

A lullaby the blithe bird sings  
When her light nest the south wind swings,  
Still sings when wild the north winds blow  
From out the land of storm and snow—  
The while the nestlings grow their wings.  
Held safe within the coiled hair rings,  
What wind of south or north wind brings  
Is naught to them, if she sing so  
A lullaby.

And peasant child or child of kings,  
Round mothers' neck the baby clings,  
Smiles out from every baby woe,  
And falls asleep, when she sings low  
With sweet bird notes and twitterings.  
A lullaby.

#### II. THE ROSE BUD.

O the red rose-tree has a bud my dear,  
So sweet, so sweet, so sweet.  
Thy mother her babe to her heart holds near  
So sweet, so sweet, so sweet.  
And the bud shall blow  
To a rose,  
And baby shall grow,  
O, who knows  
To what wonder my baby may grow.  
In the still rose-tree sleeps the bud all night  
My sweet, my sweet, my sweet.  
So sleep in my heart while the stars shine bright  
My sweet, my sweet, my sweet.

O the bud shall blow

To a rose,

And baby shall grow

O, who knows

To what wonder my baby may grow.

#### III. THE WATER LILY.

If I were a lily, a white water lily—  
A white lily—  
And you were my sweet yellow heart,  
My petals of snow should enfold you  
Till none  
But the sun  
And the stars in the blue could behold you  
So sheltered apart.  
Dream now—I'm a lily, thine own mother lily  
A love lily,  
And you are my golden sweet heart;  
My arms and my love both enfold you  
Till none  
But the sun  
And the father in heaven can behold you,  
So sheltered thou art.

### NOTES.

During the holiday week, in Chicago, a course of lectures will be held upon Goethe. Among the lecturers are Prof. Calvin Thomas, Mrs. Catherine Sherman, and Professor Davidson.

*Lead a Hand*, a Monthly Magazine of Organized Philanthropy, reaches us regularly and contains much useful information and advice upon how to improve the social, educational, sanitary and other conditions of life in the most practical way.

Professor Davidson read a series of papers at Chicago, based upon the philosophy of Aristotle. He discoursed upon three authors representing the True, the Good, and the Beautiful, whom he finds to be Thomas Aquinas, Bonaventura, and Dante. Professor Davidson is full of his subject, and an enthusiastic admirer of these heroes in the realm of thought. His presentation of the subject is scholarly as well as original, although it seems that he accepts too much of the mediæval views that attached to these thinkers, and unnecessarily places such men as Kant and Darwin in the same line with materialism and other destructive philosophies. We hope that Professor Davidson will have the lectures printed.

*Naturwissenschaftliche Wochenschrift*, published by Hermann Riemann, Berlin, N. W. 6 Luisenplatz 11, is a journal of Natural Science and contains articles of interest for all. In the latest number, of December 2d, Boenecke discusses the structure of the Brocken mountain with diagrams. Professor K. Kraepelin calls attention to the importance and educational influence of Museums of Natural History. Another article is dedicated to the memory of William Herschel. Among the correspondents we find a letter of Dr. Victor Schegel's on Four-dimensional Space. Schlegel, it may be mentioned, was a younger colleague of Professor Grassmann whose work in the empire of mathematics is discussed in the editorial on pages 1370 and 1371 of *THE OPEN COURT*, and has done much to call the attention of scientists to Grassmann's 'Theory of Extension.'

### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER XXVIII

The Sovereign still continued silent; at last he began, in a bitter tone:

"What you tell me surprises me. Considering you as the Prince's instructor, I may speak more openly to you than to my household. The Prince has a weak character, and I have no confidence in his future."

"He gave us the impression of having, under all this shy reserve, the qualities for the formation of a firm and noble character," replied the Professor, respectfully.

Ilse thought that this was the moment to introduce something advantageous to the Prince.

"May I venture to tell your Highness, which my husband entirely approves of, that the Prince wishes far more knowledge concerning agricultural industry? As I am myself from the country, your Highness will forgive me if I should say that this is the best school for our dear young Prince."

"On the estate of your father?" asked the Sovereign shortly.

"Anywhere," replied Ilse, innocently.

"I have never heard him express any such wish,"

\* Translation copyrighted.

concluded the Sovereign, rising. "In any case I am grateful to you for the interest you take in his future."

He took leave with an air of reserve, and returned to his daily business.

The day was a difficult one for all who had to do with him. He rode out with his aide-de-camp into a rough, woody country, where his soldiers after a night-march were practising field service. Generally he cared little about the details of manœuvres, but on this occasion he harassed his aides-de-camp and soldiers by sudden changes of disposition. When the soldiers at last returned home exhausted, he went to inspect a distant stud and a plantation, and wandered about four hours on rough hill roads. No one could do anything to suit him—blame and bitter remarks alone fell from his lips. In the evening there was a Court concert; the aide-de-camp, tired to death, stood in the hall, counting the minutes till his retirement. Then the Sovereign on withdrawing, called him to his study; there he seated himself in an arm-chair near the fire-place and gazed at the fire, occasionally put on a log, and held the silver handle of the fire-tongs in his hand, striking it at intervals on the iron bars of the grate. Meanwhile the aide-de-camp stood some steps behind him, one hour, two hours, till he was ready to faint. It was not till the middle of the night that the Sovereign rose and said, "You must be tired; I will not detain you longer." He spoke this mildly, but his eyes glittered with an unpleasant gleam, and the aide-de-camp acknowledged later to his intimate friends that he should not forget that look as long as he lived.

"The Sovereign has visited the pavillon for the third time!" said the Chamberlain, to the Hereditary Prince, who was sitting in his room with his throat tied up. The Prince looked down on the book which was lying before him.

"Do the guests seem to like their residence here?"

"I cannot say that of the Professor's wife: I fear she is placed in a difficult position here. The marked distinction which his Highness shows her, and certain old recollections which attach to the pavilion——"

The Prince rose, and looked so indignantly at the Chamberlain that he became mute.

"The Sovereign was very ungracious to-day," he continued, in a depressed tone. "When I reported to him concerning your Highness's health, I met with a reception which was not encouraging."

The Hereditary Prince approached the window.

"The air is mild, Weidegg; I shall endeavor to go out to-morrow."

The Chamberlain was very uncertain how this decision of the Hereditary Prince would be received: he departed in silence.

When the Prince was alone, he tore the shawl from his shoulders and threw it on one side.

"Fool that I was! I wished to preserve her from gossip, and have exposed her to worse. I myself sit here in seclusion, and my father visits her in my stead. It was a cowardly device. If I cannot avert what is impending for this poor creature, I will play my part in the game that is beginning."

When the Prince on the following morning went to his father, the latter began, with calm coldness:

"I hear from strangers that you have the desire to obtain some knowledge of agriculture. The wish is sensible. I shall consider how you can find an opportunity to obtain this knowledge somewhere in the country. It will also be advantageous to your health, and will agree with your inclination for a quite poetic life."

I shall do what my honored father bids me," replied the Hereditary Prince, and left the room.

The Sovereign looked after him, and murmured:

"Not a word to be got out of him but cowardly submission; always the same submissive compliance. Not an eyelash moved when I ordered him to do what was unwelcome. Is it possible that this pliant boy is a master of dissimulation, and is deceiving me and all of us?"

If Ilse in spite of the distinction with which the Prince treated her, had a foreboding of the dark shadow which hung over the pavilion, far different was the tone of mind of her husband; he lived in the midst of the interesting investigations to which the museum gave rise, and the poetry of his earnest mind worked busily, and cast a brilliant lustre over his sojourn in the capital. He was a hunter who trod with light step over his hunting ground, breathing the pure mountain air, whilst around him the rays of the sun gilded the mossy ground and heather. The time had now come when that of which he had dreamt for years was within reach of his hand. It is true the new track of the manuscript remained indistinct. The fate of that chest which had been mentioned in the old letter could not be ascertained. In the Prince's library, and in a collection of books in the city, there were found neither manuscripts nor other books which could be ranked among the possessions of the monastery of Rossau. He had renewed his acquaintance with the head-forester, but the latter could think of no place where old hunting implements were kept. He went through old catalogues of the Marshal's office, and nowhere could the chest be discovered. But it was more strange still that the name of a royal castle Solitude was quite unknown in the capital. The castle, like one in an old legend, had vanished. But, strange as this circumstance was, yet the account of the student

had won for this old letter of the official an importance which gave the searcher hopes of a good result. For only a few years ago some one, who knew little of the value of such a narrative, had seen the Rossau chest. It was no longer a deceptive image from a distant past; on any day a lucky accident might lead him to it. But when the Professor gazed on the slate roof of the royal castle, and ascended the grand steps, he had always a joyful presentiment that he was now near his treasure. With the help of the Castellán he had already examined the whole ground-floor of the castle; he had climbed up under the beams of the old roof like a marten, and had opened the old garrets, the keys of which had not turned for a generation. He had found nothing. But there were other houses belonging to the Sovereign in the town and neighborhood, and he was quite decided to examine one after the other secretly.

In this time of restless agitation, when his fancy was always opening new prospects, intercourse with agreeable persons was very refreshing. He himself, in this state of excitement, proved a good companion, and observed with cheerful interest the proceedings of those about him. The Sovereign showed him great distinction, and the young noblemen were very attentive; he took his place among them with dignity and without pretension.

The Chamberlain informed the Professor how much the Princess had been pleased with him, and Felix rejoiced when one forenoon she and her lady-in-waiting visited the museum, and begged for his guidance. When the Princess was going away, thanking him, she begged he would mention to her some books from which she could herself learn a little about that portion of the life of antiquity, the ruins connected with which he had shown her; she told him also of an ancient vase which she possessed, and asked him to come and see it.

The learned man was now standing with the Princess before the vase. He explained to her the subject of the pictures, and told her something about the old Greek pottery. The Princess led him into another room, and showed him some valuable sketches. "I wish you to see all I possess of objects of art." While he was examining these, she began, suddenly: "You have now learnt to know us a little, and how do you like us?"

"I have met with great kindness," replied the Professor, "which is agreeable to one's self-esteem; it gives me pleasure to observe a life so different from that of my circle and people, who are differently bred." "In what do you find us differently bred?" asked the Princess, pressingly.

"The habit of acting your part fittingly at every moment, and maintaining your position among others,

give persons an easy confidence, which always has a pleasant effect."

"That would be an advantage which we share with every tolerable actor," replied the Princess.

"At all events, it is an advantage always to play the same rôle."

"You think, therefore, it is no longer art if we become adepts in it, and act our part well," rejoined the Princess, smiling; "but in that also there is danger; we are from childhood so much accustomed to behave suitably, that it endangers our sincerity; we observe the effects of our words, and we soon think more of the good effect than of the purport of what is said. I myself, while talking with you, remark with pleasure how much I please you, yet I am nothing more than a poor princess. But if our aptness in presentation pleases you, in like manner we are attracted by a character that is calm and confident without attending to outward appearances; and perhaps a deficiency in the forms of society and the plain speaking of a powerful mind are interesting to us, if they do not wound our feelings, for on this point we are sensitive. Whoever would wish to leave a pleasant impression, would do well to treat our pretensions with consideration. I do not wish you to treat me so," she said, interrupting herself, "but I am solicitous on your account. Yesterday I heard you flatly contradicting my father. I beg of you to have regard for our weakness, for I hope that you are still to remain long with us."

The Professor bowed. "If I opposed his views more warmly than was necessary, it is because I lie under a temptation which is dangerous to men of my calling. Disputation is the weakness of men of learning."

"Good, we will reckon up our qualities one against the other. But you are in the happy position of always attacking things boldly; we, on the contrary, must be cautiously on the defensive. The great importance of external appearances is instilled into us from youth, and cannot be dispensed with. With you there is probably seldom any strife about precedence, and I fear it is quite immaterial to you what place you take in our degrees of rank; but these things are great events to us, not only to our Court, but still more to ourselves. Many of us are for days unhappy, because we have not taken our proper place at dinner. Many visits are discontinued on that account, old alliances are broken off, and there is frequent quarrelling behind the scenes. When we occasionally meet with clever people of your stamp, we ourselves laugh over these weaknesses, but few are free from them. I have already fought for my place at dinner, and made a great fuss about it," she added, with good-humored frankness.

(To be continued.)

## BOOK REVIEWS.

AMERICA'S YOUNGER POETS. A Collection of Poems by America's Younger Poets. Vol. I. Philadelphia: The Westminster Publishing Company, 619 Walnut Street. 1888.

America is too much reproached for lack of Poetry and Idealism. The neat volume before us is the best proof that the spirit of poetry has not died. We find beautiful gems in this collection from the pens of Frederic Allison Tupper, Ella Higginson, Ella Du Birg, S. Mansfield, Geo. L. Raymond, etc. We miss the name of Mr. Louis Belrose, Jr., whose poems are marked by unusual force and grace. Some of the finest verses are written by our contributor, Gowan Lea. Most tender and thoughtful appear the following lines:

I watch the birds that hop about my feet  
Across the lengthening shadows on the lawn,  
And see them perch upon the slender twigs,  
And lightly sway themselves from tree to tree,  
Then soar into the peaceful blue of heaven,  
And send to earth a perfect flood of song.

Oft will man envy these glad birds their wings,  
Forgetting his soul's pinions, that can take  
Him on from flower to flower and peak to peak  
And upward to that vast ethereal dome  
Beyond where bird can reach or wind may blow,  
And back and forth through all the centuries  
(From ages past to ages yet to be)  
Until, as free as lark in yon blue sky,  
He soars in the pure azure of his thought,  
And utters songs that lift the human world.

THE DREAM OF LOVE AND FIRE. By *A Dreamer*. Boston: Estes & Lauriat.

The dream narrated in this volume is a prophesy given by a seer to Cleopatra about her re-incarnation after two thousand years "in a yet unknown western world." The seer, questioned by the Egyptian queen, expounds his philosophy of soul-life. "Love between souls forms a deathless bond for all eternity. \* \* \* Therefore did love give life to death and death to all that lives; for what is death but change?" Death, we are told, is the passive, and love is the active force in life; "motion underlies all life, \* \* \* and thought is but a mode of life-motion." The arrival of Christ is, in the prophesy indicated, "to raise man's fallen race in time to high estate," which is of importance for the re-incarnation of Cleopatra, because "Only the pure in soul can quickly rise to higher planes of love."

The seer's philosophy is strangely mingled with phantastic imaginations about the soul-sense, thought-force, the hidden power of colors, and of music, and about the relations of fire to life. Undoubtedly it is the author himself who clothes his views in the language of the seer.

The volume contains five beautiful photo-gravures in color, representing scenes from Cleopatra's life, after famous pictures.

There is a great deal of pleasant chat about Art and Artists in the December number of the *Art Amateur*, as well as sound technical instruction for those engaged in Decorative Art.

My Note Book opens with a slight notice of the death of Feyen Perrin, and an account of his works, which are probably little known to the general public. His best known picture is "Les Cancales." This represents an old custom of Cancale by which on a certain day the inhabitants are allowed to take from private fishing grounds all the oysters they can carry away.

The Circular of General Hawkins, the Commissioner of Amer-

ican Works of Art for the Paris Exposition, gives important information in regard to the class of pictures which will be received, and the manner in which they must be sent.

The Verestchagin pictures are pretty severely criticized. Still, they are certainly novel, and possess interesting traits which will attract attention.

We are sorry to learn that the late Exhibition of American Pottery and Porcelain was not more satisfactory. It is good to learn, however, that abundant material for this manufacture exists here—that much of the mechanical work is excellent, and that we need only more knowledge, taste, and originality in artistic design, to make this branch of decorative art thoroughly successful.

The decoration of the Home, especially that important part the Dining Room, receives much attention, and illustrations from rooms in actual use are furnished. The printed designs in color have some points of attraction. The head in "profile perdue" has some delicate coloring, and the Winter Landscape is quite effective. Some designs for ornamental crosses in Embroidery on Linen will be welcome to persons of ritual proclivities.

It is a good number with which to close the year, and we trust that the New Year will open full of promise. Z. D. C.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbott. "The great inspiration of the Nineteenth Century is faith in the ideal unities as possible in fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.

Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.

Christian Propagandism. By Francis Ellingwood Abbott. Price, 10 cents.

God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.

Compulsory Education. By Francis Ellingwood Abbott. Price, 5 cents.

The Present Heaven. By O. B. Frothingham. Price, 5 cents.

On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.

A Study of Religion. By Francis Ellingwood Abbott. Price, 10 cents.

The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbott. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.

Evolution and Religion. By John Fiske. Price, 5 cents.

Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.

The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbott. 100 pages. Price, 10 cents.

Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourn and Prof. Asa Gray. Price, 5 cents.

Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents.

The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents.

The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. James. Price, 10 cents.

How Shall We Keep Sunday? An Answer in four parts. 1. Sunday in the Bible, by Charles K. Whittle. 2. Sunday in Church History, by Minot J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 104 pages. Price, 10 cents.

Social Ideals. By David A. Wasson. Price, 10 cents.

The Decay of the Christian Church: its Causes and Remedy. By Rev. J. C. F. Grumbine. Price, 15 cents.

Natural Religion. By James Vila Blake. Price, 5 cents.

The Family Purse. By James Vila Blake. Price, 2 cents.

The Philosophy of a Strike. By N. A. Dauning. Price, 5 cents.

Uplifts of Heart and Will. A series of religious meditations or aspirations. By James H. West. Price, 20 cents.

An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR & CO., Publishers.

175 Dearborn Street, Chicago.

# "THE MICROSCOPE,"

FOR 1889.

The leading exponent of Microscopy in the United States.

The representative of what is best, most instructive, and progressive in American Microscopy.

An enterprising and liberal purveyor of Microscopical News selected from the most reliable scientific journals of Europe and America.

A reliable teacher for the beginner, and a medium through which advanced workers publish to the world the results of their labors.

Among the contributors to this journal are:  
Prof. CHAS. E. BESSEY, University of Nebraska.

Prof. T. J. BURRILL, University of Illinois.  
Prof. M. D. EWELL, Northwestern University.  
Prof. J. WALTER FEWKES, Harvard University.

Prof. C. H. STOWELL, University of Michigan.  
Prof. S. H. GAGE, Cornell University.  
Prof. H. L. SMITH, Hobart College.  
Dr. ALFRED C. STOKES.

Prof. JOHN A. BRASHEAR.  
Prof. HENRY MILLS.  
Prof. H. M. WHEELLEY.

Dr. F. L. JAMES.  
E. H. GRIFFITH, Esq.  
C. M. VORCE, Esq.  
And many other well-known writers on microscopy.

Each number is replete with information valuable to educated Americans who desire to acquire a scientific knowledge in its broadest sense.

of British Thought on the American Continent.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its columns. For rates, etc., apply to

## CHRISTIANITY AND MONISM.

A CRITICISM OF THE WORK OF "THE OPEN COURT" BY

DR. GUSTAV CARUS,

SUPERINTENDENT GENERAL OF THE STATE CHURCH OF EASTERN PRUSSIA.

THE OPEN COURT has awakened in me a high degree of interest. To be frank, however, I will have to confess that serious doubts have arisen in my mind. First, a consideration occurs which touches the outward prospects of the journal, yet which is not unconnected with its inner character. I cannot, in fact, resist the misgiving that the journal will not prosper for any great length of time in a degree answering to the expectations of its founder and calculated to encourage further efforts. Not that I would wish to question the ability, the foresight, and the skill of the editorial management! But the great and weighty problems, which the paper proposes to discuss and which, one will confess, would greatly interest every thinking and highly cultured person, are unfortunately too far removed from the average minds of the public at large as permanently to engage their attention. Added to this there comes a further consideration, which, in my candid opinion, will definitely decide the success of the undertaking. The main purpose, the philosophical conception of the world advanced by the journal, can, even to persons given to serious meditation upon the subject, afford no complete satisfaction of thought or feeling; can neither answer to the needs of the intellect, nor respond to the yearnings of the heart.

THE OPEN COURT proposes to establish the philosophy of monism. By monism, I suppose, it is understood that this theory of the universe is in opposition to the other which is generally known as dualism, and which holds that the world,—the All,—was created by a Supreme Being, a living personal God who existed before and beyond it, and that it continues to be sustained and governed by the same Power. This latter view is commonly termed Theism, in contradistinction to Deism, which, although it likewise postulates a personal God as the Creator of the world, yet totally separates Him, after the completion of His work, from all connection with the same. Deism will not allow of any permanent living relation of God with the world; it rejects His immanency, and holds that, after God called the world into being, He simply left it to itself and,

Himself refraining from any interference whatever in the course of cosmic progress, committed its further development to the newly established laws of nature. This view of Deism, I too reject; but all the more firmly established does Theism stand forth in my mind as the truly religious, the Christian, theory of the universe.

Like Theism, Monism also undertakes to uphold a single causal principle for the world, from which the further development of the All wholly proceeds. But it renounces—influenced, doubtless, by the Kantian theory of the unknowability of 'the thing of itself'—every positive determination of this fundamental principle of the world or All; going only so far as to repudiate emphatically the personal nature and the self-consciousness of its Monas. In this point it falls back far beneath Kant, who, although theoretically unable to conceive of God, Freedom, and Immortality, yet after he had driven them out through the front-door of his theory of cognition, admitted all three principles again through the back-door of practical reason:—so imbued was he with the belief that the mind cannot comprehend life and the world without God, and without accepting the continuance for all eternity of the personality of the soul.

It is, and remains, an impracticable thought to the human mind, that the whole order of the world should have been developed from a being not conscious of itself. How could organic life, Mind, Reason, the ideas of the True, the Beautiful, and the Good, have arisen: Consciousness from the Unconscious! The one the parent of the other! All that may be said in this connection against materialism, atheism, and pantheism, applies with equal force to monism.

The Monism of THE OPEN COURT, it is true, endeavors to find a higher footing, by characterizing itself as "Meliorism." It will have nothing to do, accordingly, with the theory that the world,—its origin, history, and destiny,—is the mere product of a planless and irrational condition; absolutely nothing, further, with the current theory of pessimism which finds everything in the world bad, the worst possible in fact, and sees the only way of deliverance out of the hopeless corruption of the world (the physical as well as the moral) in the annihilation and destruction of the same. Meliorism, more properly, proposes to stimulate the ethical aspirations of free rational agents towards ef-

fecting an ever more complete organization of all the forms of life; and, in so doing, it advances the astonishing proposition, that with the moral ennoblement of free rational agents the conditions and relations of the world in general will assume higher and more perfect forms:—through the agency of what power it does not say.

A meliorism of this character reflects honor upon the depth and tone of mind of its advocates; it recognizes that it would be both unreasonable and impious to suppose that the All (to use its own language), led a roving and vagrant life, without reason, aim, and purpose. The deficiency present in the system regarding the knowledge of the "Whence" of the world, it seeks to supply, in some measure, by an emphatic affirmation of a definite "Whither"! This, as was said, does great honor to the tone of mind of its advocates. But, scientifically regarded, these promises and expectations, as well as the ethics founded thereon, from the very principles of meliorism itself, are unwarrantable. Whence, pray, does Meliorism know all about the moral and cosmical purpose of the world? It itself has no speculative methods to derive it from itself; while geology, and the natural sciences in general, as well as history and experience, afford us numerous instances that militate against it. The eschatological views of a perfected world-arrangement expected in time to come, when considered even from the standpoint of monism, cannot but be regarded as poetical reveries and illusive phantasmagoria. They are, in fact, nothing more than defaced and distorted remnants that have been unconsciously torn from the body of the Christian theory of the universe. With the fundamental conception of Monism itself they stand in sharp antagonism and find in it no organic position. In no instance, in fact, has the Pantheist, or however else the denyer of God may choose to call himself, ever upheld either the free moral agency of the soul (which is after all the postulate of all ethical claims) or the blessedness hoped for from the further development of the world.

A further defect of this melioristic Monism lies in the fact, that the universal aim of the world,—to realize which we are to aspire, and the fulfillment of which is promised and believed,—is separated from the life-aim of individual rational beings. None of the latter, according to that system, has an aim in life. No other value is assigned them than to be transitional stages on the high road of universal progress—manure, merely, for the fields of universal history; joints and bolts in the machinery of universal evolution, that are thrown away when worn and spent. But one exception to this is made and that in favor of the creatures living at the close of the evolutionary process; although even their fate and course of life are but sketched in

misty outlines. What ruthless cruelty is thus imposed upon the All, in that the cup of bliss is kept alone for a race of individuals who are to appear at an infinite distance of time, while all that have gone before, burdened by a horrible fate, must perish in the process. Where does Monism know all this from? Where will Monism find scientific support for all this? It is nothing but dreams and phantasms that is offered here—aërial flights.

My intention here was simply to point out in brief the scientific incompleteness of the monism characterized as meliorism. It is a view of the world which has no solid foundation beneath it, and which lacks all logical consistency; a view which, as the best it can give, offers nothing but phantasies and illusions, neither affording an assurance that the latter will ever be realized, nor adducing an authority for condemning thousands of generations and demanding of them to thrill with enthusiasm for dreams and fictions, while really requiring them to lead a wretched existence. If, however, in so far as that may be at all possible, the monistic theory of the universe becomes strict and logical—a coherent and consistent system in itself, stripped of its melioristic phantasies—we would then have a theory of the universe which, theoretically, might stand a little higher than the so-called meliorism, but which breathes the deadly breath of absolute hopelessness, and of degradation of the personality of man,—wholly apart from the truly fearful consequences, which I will not consider, that such a doctrine, if it ever became the common property of the human race, would unfailingly draw with it.

But one of two things, however, is possible; there is no third course: *Either*, we are to deny a personal God and then be compelled by a meagre rational process to rest content with the notion that the world is the product of accident (which every sound mind must regard as utter nonsense), and as an unavoidable consequence be forced to renounce the substantiality of the soul, its freedom of will, its immortality, in brief to abandon every higher dignity that pertains to man; *Or*, we are resolutely to accept a living God and to honor Him. Then does light come into darkness, and then are we enabled to render rational the recognition of mysteries that, at the present stage of our existence, we cannot fathom.

The world-mystery can be solved only upon the basis of the religious, the Christian, conception of the universe. Christianity is and remains the only true philosophy that equally contents the mind and the soul, that satisfies alike the thought of the intellect and the yearnings of the heart. Our ancestors, with this in view, called the soul *anima naturaliter Christiana*, which means that the soul is naturally predisposed to the acceptance of the Christian philoso-

phy. No other philosophical view will ever gain a firm footing in the human mind,—in no case one which denies the living God and so deeply degrades the personality of man as to dispute its moral freedom and eternal lastingness.

Should THE OPEN COURT, in the eventual development of its intellectual aim, determine to conceive the Monas of its Monism in this sense, namely, as a personal God, and thus to give its meliorism the proper substruction, I would then entertain the hope of its further support and continuation. The course of intellectual development in Germany has long since taken this direction, and really cultured minds have long since discarded the threadbare remnants of Atheism, Pantheism, Deism, or of whatever else the forms of God-renunciation may be called. Thence the present youthful revival among our people. The quibbling sophistries that delight in renouncing God, the Freedom of the Will, and the Immortality of the Soul, are long since recognized as the marks of a degenerate and imperfect culture that can only stifle the vigor and energy of life, and which must stunt in a people the sense of the true worth of human life, should these irreligious and unethical principles ever assume a serious front and no longer remain the mere mental freaks of literary adepts. For irreligious and unethical they certainly are, even though by a misuse of language they be called religious and ethical. There is no religion without a personal God; and without free will, without accountability for acts and omissions, there is likewise no morality.

#### THE RELIGIOUS CHARACTER OF MONISM.

IN REPLY TO THE CRITICISM OF DR. GUSTAV CARUS.

The proprietor and editor of THE OPEN COURT have the honor of presenting to their readers a criticism on the work of this journal written by one of the most prominent clergymen of Germany. Dr. Gustav Carus, the father of the editor of THE OPEN COURT, is the Superintendent General\* of the State Church of Eastern Prussia. His views are an accurate and true exposition of orthodox Christianity in Protestant Germany based on and combined with scientific and philosophical erudition.

Before entering into the details of the discussion it must be stated that our venerable and most respected critic has allowed some misconceptions concerning the tenets of THE OPEN COURT to enter his mind. The Monism of THE OPEN COURT, although it opposes the systems of orthodoxy, differs fundamentally from the prevailing freethought, which destroys and intends to destroy all religious life and faith and ideals.

It differs especially from that view which is commonly called Materialism,—a view which the cruder it is, the more radical do its advocates consider it.

Freethought is so much identified with Materialism that this prejudice has been and will, for a long time still, be one of the greatest obstacles to the progress of freethought. The Monism of THE OPEN COURT is not a mere destructive philosophy of negation which considers religion as a superstition, and the order of the world as the fortuitous result of blind forces; it is not satisfied with the negative results of agnosticism and most emphatically objects to the belief in any unknowability. The Monism of THE OPEN COURT, taking its stand on the unitary conception of science, considers the irrefragable law of nature as the basis of morals, to which man's conduct must conform. The Monism of THE OPEN COURT is not an irreligious renunciation of the ethical *ought* for the scientific *must* as represented in cosmical laws. Nor is it a repudiation of science and the scientific recognition of the *must* which, as theology maintains, must be denied or at least limited, in order to make room for freedom of will and moral responsibility, which are the conditions of the ethical *ought*. The Monism of THE OPEN COURT is in so far a new philosophy as it proposes a unitary conception of the world not only in the province of scientific enquiry but also in ethics and religion. The *ought* of ethics and the *must* of nature are two aspects only, of one and the same reality. The freedom of will, the self-determination of a rational being, is not at all annihilated by the fact that all events in the world proceed necessarily from their conditions. Monism fully accepts the doctrine of the freedom of will, although the idea is rejected that freedom of will means a fortuitous outcome of chance which cannot be determined by, and is not subject to, certain laws.\* What man feels as an *ought*, or categorical imperative for his *conduct*, does not proceed from a mysterious power but is the natural outgrowth of his rational nature. It is a necessary result of life's evolution on earth; and the *ought* must be obeyed under penalty of evil consequences or even of annihilation (for death is the meed of sin) and the *ought* must lead humanity onward on the path of progress. 'Must' and 'ought' are both proper expressions, although one-sided,—the one for scientific, the other for ethical purposes,—yet both are expressions of one and the same fact and thus complementary. There is in reality neither a *must* nor an *ought*, but only an *is*. Ethics as well as science tries to go beyond the *is* of the present, by searching for its *whence* and *whither*. The 'whither' appears to science as a 'must,' to ethics as an 'ought'; but it is both a 'must' as well as an 'ought,' being an *is to be*.

\* The position of Superintendent General in the Prussian Church is comparable to that of Bishop in the Anglican.

\* See the Editorial in No. 33, "Determinism and Free Will."

Far from denying either the order of the world which finds its proper formulation in the *must* of science, or the moral responsibility of man as the condition of the ethical *ought*, the Monism of THE OPEN COURT unites and identifies both in so far as it derives and explains the one from the other.

From this standpoint the old theologies do not appear as mere phantasms or nonsensical vagaries, but as a necessary stage in the development of religious thought. They are founded on truth in so far as their ethics upon the whole are correct. They are wrong in so far only as they place themselves from principle in opposition to science. No supernatural revelation is needed to teach man his duties of life. The whole universe is open to our investigations. In the grand book of Nature we must look for the sole and true revelation, not only to understand the *is*, but the *must* and the *ought* also;—not only to grasp the actual *here* of the present, but also the *whence* and the *whither*. Only by studying the *whence*, can we hope to find information as to the *whither*; and the preacher of morals, we maintain, must search for and will find a justification of his ethics in science. There can be no conflict between true ethics and true science, and whoever finds himself driven to acknowledge such a conflict, he may rest assured that either his ethics or his science, perhaps both, are wrong.

But a conflict between science and ethics must necessarily take place the moment the idea of a supernatural revelation is accepted. The belief in a supernatural revelation leads unmistakably to Dualism. It separates man into his soul and his body, and the unity of All-Existence into a living God and a dead nature. According to Monism Nature is a Cosmos, a living whole which has its law and order in itself as an intrinsic property. Therefore, Monism considers the personality of God as a mere allegory. Man is the son of nature and may be called a microcosm in so far as in his mind the order of the cosmos is mirrored. He is the highest representation and realization of that order on earth, and thus, biblically speaking, a being created in the image of God. Therefore it is but natural and justifiable that man should create his God in his own likeness. Theism is a grand, but nevertheless anthropomorphic and erroneous, conception of Deity.

In creating God after our own likeness we should be careful to select those qualities which are most essential and imperishable. The order in our mind, which is commonly called reason, has grown from the order that pervades the universe. The law and regularity of the universe are not only imperishable but they are also that feature which renders nature divine and grand.

If we create God in the likeness of our ego as a

personal God, we attribute to him the limitations to which we are subject, and we endow him with our most perishable and most defective qualities. In this way we would be forced to accept the most incredible impossibilities of his mysterious existence.

It is stated on page 1379 of THE OPEN COURT: "It is, and remains, an impracticable thought to the human mind, that the whole order of the world should have been developed from a being not conscious of itself." We object to this conception of the world. Order itself is *not* developed but *the present state* of order has been developed. Order in the world is immanent.

The word order is used in two senses; in the objective sense order is identical with necessity or conformity to law. This objective order has not been created and cannot have been created. Thus Kepler's law, that the radius vector of a planet describes equal areas in equal periods, is an immanent law which we can not think of as having been developed from or by a conscious being. It can not have been ordained or posited as an act of purpose or design. All these laws can be formulated and computed by mathematics and arithmetic. All the wonderful order of the universe is ultimately the same regularity as that which is found in the simple rule of  $1 + 1 = 2$ , or  $2 \times 2 = 4$ . The difference between these simple equations and Kepler's law is entirely one of more or less complexity. Laws as  $2 \times 2 = 4$  and other formal laws can not have been created or established in the same way as ukases are issued by a monarch. They are recognized as immanent and intrinsically necessary.

In a subjective sense, order is that arrangement which best conforms to and agrees with ourselves. This subjective kind of order is not intrinsically necessary, but must be created by our efforts and our labor. In creating this subjective order, nature being the raw material for man's work appears to man as wanting in order and conformity. But this want is merely relative; nature lacks conformity only to some special needs of man. In truth a realization of the subjective order or the conformity of nature to man's special needs is only possible by reason of that objective order of nature which we have learnt to be immanent and necessary.

The doctrine of Meliorism, which in the Editorial of No. 48 is represented as the ethical aspect of Monism, has been proposed in opposition to Optimism and Pessimism.

Christianity is usually ranged among the pessimistic religions. Schopenhauer points out that it considers the world as bad in its foundation. The prince of this world is the devil, who allures and entices to a transitory sham-happiness. Christ came into this life to suffer and die, in order that he might show the

way of salvation. Man is a stranger, a pilgrim in this world, and destined to suffer for the purpose of purifying his soul. The symbol of Christianity is the cross, an instrument of penal torture, and indeed in those times crucifixion was most degrading—the capital punishment for slaves and criminals.

Certainly this world does not exist for happiness, or Christianity would not have overcome the most civilized races on earth. We should bear in mind that life itself has no value, yet life may acquire value through what it contains. If our days are passed without actions worthy to be done, then they are indeed spent as a tale that is told, although they may be four score years or more. Our actions can give and must give value to the days of our life, yet is their strength labor and sorrow. For a life worthy to be lived is one that is full of active aspiration for something higher and better.

Christianity, however, is not pure pessimism; it propounds most valuable melioristic ideas, which are seen in its ideals of "Faith, Hope and Charity." The pessimistic features of Christianity were most predominant during the middle ages, in the asceticism of the monks and their unnatural repudiation of earthly things. The Meliorism of Christianity came to the front since the Reformation. Luther's marriage was a moral deed which denotes a rupture with the pessimistic view of the meritoriousness of celibacy. The marriage of a clergyman whose whole life is to be devoted to religion, marks a progress to Meliorism. It shows that the religion of the Reformation no longer intends to be at variance with the world and with human life on earth.

The Meliorism of the Monistic philosophy, we admit, is an outcome of Christianity. But it is not "a distorted remnant of Christianity." It is the next step in the ethical evolution of mankind. Nor does it stand in contradiction to the Monistic conception of the world. On the contrary, it is the inevitable consequence thereof. Dualism, which tears asunder the unitary cosmos, naturally leads to pessimism. It teaches to abandon life with even its most innocent enjoyments, to retire from the world and from worldly aspirations for the sake of another world and the ghost-existence in an imaginary beyond. The purpose of ethics must find its sphere here on earth, nor should the *whence* or *whither* of life be disconnected from the present. It was the monistic tendency of the Renaissance, and the regeneration of the sciences chiefly, that brought about the melioristic trend of the Reformation. Therefore Monism alone can teach the harmonious ethics of Meliorism.

Meliorism, in the sense defined by THE OPEN COURT, does not sever "the universal aim of the world from the life-aim of individual rational beings;"

nor does it teach that the purpose of life is some Utopia in the far distance where a universal happiness will be realized. The ethical import of life lies always in the present; its worth, its merit and strength are the work done in the present. It is undeniable that an increase of happiness, a progress of refinement, of culture, of comforts, and of civilization will accompany man's work. But this increase of refinement will at the same time increase sensitiveness, and many wants which are scarcely heeded at present, will, under other and more advanced conditions, cause pain. Progress will not lead to complete happiness or to a state of absolute perfection; happiness is too subjective and perfection an ideal that admits of constant improvement. Pleasure and pain are two correlative factors, which almost always have stood, and will stand, in the same ratio.

The effects of progress must not be conceived as the final realization of an undisturbed state of happiness. This would be standstill,—stagnation. The direction toward which evolution tends is not a goal which will ultimately be reached. It is a direction toward improvement which does not admit of absolute consummation. Therefore the criticism offered on page 1380 of THE OPEN COURT, that the single individuals are considered merely as manure for the fields of universal history, may be applicable to Condorcet and others who believe in a final state of perfection in which the cup of bliss is preserved for the few elect who happen to live in the ages of a dim future. Meliorism recognizes the entire and full presence of the All in all generations; and the objection being made that the present generation toils while future generations will reap the benefit of its work, we answer that the present generation enjoys the benefit of the labor of former generations; and these former generations are not strangers to the present generation, but their ancestors, just as future generations will be their descendants; or, expressed in other terms, the present generation is the continuance of former generations and will continue to exist in future generations. Monism teaches the unity of mankind with regard to the different ages also.

The unity of mankind explains the seeming injustice and cruelty of the order of nature (or if you prefer of God), that children have to bear the sins of their fathers into the third and fourth generation. But on the other hand, it is promised that they shall inherit their blessings into the thousandth generation.

In this idea of the unity of mankind we find the explanation of the immanent immortality taught by Monism. The continuance of life beyond the death of the individual in the work performed during life and especially in our children is no mere sentimentality but a powerful truth which in the system of Monism

and Meliorism finds a prominent place as a fundamental religious truth.

The God of Monism is a living presence although he is no longer recognized as an ego like ourselves with successive states of consciousness. Taking this ground, Monism is not driven to the alternative of accepting either horn of the dilemma: The order of the world is either the work of a personal God or the fortuitous result in the play of blind forces. According to our view God is the omnipresent order of the Cosmos, but he is immanent and not transcendent.

Monism affords a basis for a religion which can satisfy both the heart and the head. The most radical free thought and the most rigid investigations of science cannot be injurious to religion; they will prove salutary by removing erroneous conceptions, thus purifying and elevating our religious faith and ethical aspirations.

P. C.

#### DEATH AND LIFE.

BY GEORG VON GIZYCKI.

Translated from the German by *mupe*.

"Du hast Unsterblichkeit im Sinn;  
Kannst du uns deine Gründe nennen?"  
Gar wohl! Der Hauptgrund liegt darin,  
Dass wir sie nicht entbehren können.—*Goethe*.

It is not right to represent death as something fearful and to increase the inborn dread of dissolution by poetic fictions. Would it really be better if there were no death? Let us suppose that man lived forever. Mankind would soon have multiplied to such an extent that further growth would be fatal. No children could be born, and there would be only grown persons in the world. All family life, all the happiness that man finds in the pleasures of home, would be at an end. Would that be a desirable state of affairs? "Life," says Goethe, "is the most beautiful invention of Nature, and death is her device for having much life." And a priest of the Order of Jesus exclaims: "Truly the coffin conditions the cradle, and we might almost affirm that from death springs the buoyant vigorous life that unceasingly pulses through the veins of the human race."

Ludwig Feuerbach, the "atheist," imbued with love, and hope, and faith in humanity, says the same. When you look into the happy eye of your child, so bright, so clear, and so joyous, "as though the world were of to-day," then think that only at the cost of death has this been won. The love of wife and child is not too dearly paid with death. And life in itself is worth that death be given for it. It was for this reason that the ancient Greeks pictured nothing sorrowful and gloomy upon the tombs of the dead, but the happiness and joy of life.

\* "You've immortality in mind;  
Can you your reason give?"  
The most important reason is,  
We can't without it live.

The great physician and philanthropist, Hufeland, says: "How greatly do they deceive themselves who believe that by refusing to entertain the thought of dissolution they find a protection against the horror of death. Ere they are aware of it, in the midst of light-hearted pleasure, that thought will overtake them and the more unaccustomed they have made it, the more fearfully will it crush their blithesome hearts. I can call him alone happy who has brought himself to think of death in the very midst of merry-making without being disturbed by the thought; and my experience teaches me that by frequent communion with this idea and by chastening the forms in which it appears to us, we may accustom ourselves to regard it with extraordinary indifference. \* \* \* He who no longer fears death, alone is free in life; there is no longer anything that can fetter him, can make unhappy, or render ill at ease. His soul becomes imbued with lofty and unconquerable purpose, inspiring the very springs of life, and he has found a certain means for putting away the thought of his dreaded foe."

Wer dem Tode in's Angesicht schauen kann,  
Der allein ist ein freier Mann.—*Schiller*.

[Who death in the face unflinching can see,  
He alone is a man and free.]

With overpowering reality, in the story of "The Death of Iwan Ilitsch," has Count Leo Tolstoi portrayed the truth, that only the person who from early years has prepared the way for death, dare hope to find joy in life. Much that he there pictures he had himself experienced, as his "Confessions" show. He numbered nearly fifty years when the thought of death came upon him with fearful force and almost irresistibly drove him to suicide.

"The terror of that darkness," says Tolstoi, "was indeed too great, and I longed to rid myself of it at once, longed to break these fetters by a ball or a rope. Long, long ago, was the tale told of the traveler in the desert that fell into the well. Below the serpent, death, awaiting my fall to rend me to pieces; I cling to a branch, and cannot understand why this anguish has taken possession of me. And that honey that lay within my grasp, that honey that I have sucked to my delight—no longer gives me joy; but the white and the black mice gnaw, day and night, the branch to which I cling. Plainly I see the serpent—and the honey is no longer sweet to me. The former deceit of the pleasures of life that blinded in my eyes the terrors of this serpent, will delude me no more. One thing I see—that unavoidable serpent and the mice,—and I cannot turn my eyes from them."

So spake the great Russian poet, that too late in life became familiar with thoughts of death. Let us therefore in due time hearken to the warning cry of Abraham a Sancta Clara: "O man, let it be told thee,

let it be mourned to thee, cry it out and write it out to every one, and everywhere: We must die, not perhaps, but surely. When die is uncertain, how die is uncertain, where die is uncertain, but die is certain."

To die is certain. Yet one consolation remains to us, even though death be truly the end of all, though it be our real consummation.

Has not every period of life in itself a value? and will this be lessened thereby, that each of these comes to its end? The life of a child has not merely a value as a period of preparation for the life of the grown person, a means to an end, but it has in itself a peculiar worth of its own. When the happy life of a child is brought to an end, we mourn it because we would gladly have seen that life continued; yet it has not for that reason been in vain, for in every moment of its existence it had a value of its own. And when a person has passed through the period of childhood, he is not wont, in so far as his new stage of life is also pleasant to him, to mourn over the destruction of the former period. The life of the young man and the young woman has a worth peculiar to itself. And so the man and the woman do not lament that their former life is past, when they feel happy in their present one. And, further, even the life of the aged man and of the aged woman has its peculiar worth—although this does not exclude the truth that one period in life has a higher worth than another. The normal period of old age is not one of ailment; but it is a period in which the charm of life gradually passes and the need of rest enters.

If we consider the matter in a reasonable light, we shall not have reason to lament, but we will recognize it as an harmonious and satisfactory arrangement. From the fact that a thing will not last forever, it does not follow that it has no value: it has had its worth so long as it lasted. It is not an endless continuance of individual life that we wish, but a rejuvenation of life by the appearance of new beings, a recommencement of the rhythm of childhood, youth, manhood, age, and death—as it actually exists in nature.

What would most people desire if they could determine their fate? To become a child again, and then a young man or young woman, and then a man or a woman. But we would not live our own life over again, but a different one. You have, then, what you want, if you but abandon your selfish longing—if in your thought and feeling you become one with humanity.

#### THE PSYCHOLOGY OF THE CELL.\*

##### I. M. CH. RICHTER'S CRITICISM.

At the beginning of his essay upon the Psychic Life of Micro-Organisms (*Revue Philosophique*), M. Binet expresses himself as follows: "In the lower beings that represent the simplest forms of

life, we find manifestations of an intelligence which greatly transcends the phenomena of cellular irritability. Thus even on the very lowest rounds of the ladder of life, psychic manifestations are very much more complex than is usually believed, and the conception of cellular psychology which some very recent authors have formed, seems to me a very crude analysis of the most delicate of phenomena."

As I have upheld in my *Essai de Psychologie Générale*, and in some measure—however little—developed this admittedly old idea, that cellular irritability is the beginning of psychical activity, I request the permission to speak in defence of an opinion so roughly handled by M. Binet.

Now, it appears to me that M. Binet has allowed himself to become involved in illusion respecting the word *cellule*. A cell, in the eyes of the embryologist and the morphologist, has a well-defined meaning. But M. Binet does not seem to have comprehended the fact, that for the physiologist and the psychologist, the essential condition of cellular unity is homogeneity. It is possible that the infusoria, the strange story of whose life M. Binet relates to us, are single-celled organisms. I am in no wise qualified to decide as to this; but whether a single cell, or a group of cells, it matters little, in my opinion, provided the single cell is differentiated to the same degree that it would be if composed of several cells not homogeneous.

I appeal to M. Binet himself and to the cuts of his essay. When he shows us an *Englena* with eyes, œsophagus, mouth, contractile vesicle, contractile reservoir (fig. 6); when he carefully describes the shape of the flagellum, the nettle-like tentacles, the tongue-shaped organs, the ocular spots, the trichocysts, and the peristome; when he assumes special *nerveous centres* endowed with various attributes (p. 1141); he cannot induce us to admit that the psychology of these complicated organisms is the same as the psychology of the simple cell. I repeat, it is quite immaterial to me that people affirm by the authority of embryology that this or that is a single cell. If that *cellule* have ocular organs, a nervous system, a mouth, an œsophagus, and a heart, I shall, despite any and every hypothesis of the embryologists, refuse to regard it as being physiologically a homogeneous cell, as is, for example, a muscular fibre.

The size will not affect the matter at all. The same desires, says Montaigne, stir mite and elephant alike. The psychic life of the bee is as complex as that of the whale, and if a microscopic infusory possess eyes, mouth, prickles, and heart, it evidently possesses them in order that it may make use of them, and accordingly I shall treat it as a complex organism upon the same ground that I do a snail or a grasshopper. Embryology will not force me to the extremity of regarding such a creature as a simple organism because it is derived from a single cell.

In my opinion, therefore, it is that unfortunate word *unicellular*, that has made M. Binet believe that, Infusoria being unicellular organisms, the elementary psychology of the *cellule* applied to them. M. Binet has allowed himself to be deceived by a word—a thing that often happens in matters of science. For my own part, in order to avoid any confusion, I would like to say that the elementary psychology of the *cellule* ought not by rights to be applied to anything except to homogeneous *cellules*; for the psychology that has to do with complex cells—real organisms with organs and apparatus of their own—must certainly be as complex as the psychology of animals wholly differentiated.

The laws of irritability act in all their simplicity and rigor among simple beings. In fact, in every instance of investigation into the nature of simple organisms, or such as appear simple by the optical instruments at our disposal (a fact that does not always rigorously prove their simplicity), as bacteria, for example,—we find that chemical irritability is the apparently sole law of movement. What else, indeed, are the movements of those bacteria so

\* Correspondence between M. CH. RICHTER and M. ALFRED BINET upon the Psychic Life of Micro-Organisms. Translated from the *Revue Philosophique* by *μυσκ*.

thoroughly studied by M. Engelmann, if not an affinity for oxygen, in other words the simplest and most universal chemical phenomenon in all nature?

And so the critique of M. Binet will not stand. On the contrary, it seems to be well established that complex organisms, whether single-celled or many-celled, have a psychology corresponding in complexity to the degree of differentiation their organs have attained, while simple beings—and they are simple only if homogeneous—have a simple psychology which is probably contained in the laws of Irritability only. CH. RICHEL.

## II. ANSWER TO M. CH. RICHEL.

A great difference of opinion exists between M. Richet and myself. In his *Essai de Psychologie Générale*, M. Richet has written the following lines: "There exist simple organisms that seem to be nothing more than a homogeneous assemblage of irritable cellules. Motory reaction, consequent upon irritation from without, constitutes their life of relation. Irritability is their life, solely and entirely, but at the same time this is, in effect, a psychical life; so that cellular irritability may be regarded as elementary psychic life."

Consequently, as may have been seen from the perusal of my essay, I have arrived at a conclusion diametrically the opposite of the above. I have shown that among the animal and vegetable micro-organisms, manifestations of psychic life are met with, which in point of complexity greatly transcend the phenomena of cellular irritability.

In giving the psychology of these microscopic creatures the name of cellular psychology, I have not invented a new term, nor given a new sense to an old one. Quite some time before me, M. Hæckel had made a study of cellular psychology and his investigations, like my own, were based entirely upon the observation of animal and vegetable micro-organisms. Furthermore, micro-organisms being represented by a single cellule (and this doctrine is now universally accepted), the study of their psychical manifestations can, in my opinion, with perfect propriety be styled cellular psychology.

M. Richet takes exception to the use of the latter expression; but he does so while substituting for the old definition of the word cell, one quite his own. To him, a micro-organism like the Euglena, which has an eye, a mouth, an æsophagus, and a contractile vesicle, would not be a cellule. To admit the latter view, means, in his own words, to become involved in illusion respecting the word cellule. In our judgment, the question here is by no means one of optical illusion, but one of verbal definition. What, accordingly, is a cellule? "For the physiologist and psychologist," says M. Richet, "the cellule has not a distinct entity, or, at least, that entity, that unity, lacks an essential condition, namely, homogeneity."

To M. Richet, the cellule is a homogeneous body; a body that comprises differentiated parts is not a cellule.

It is unnecessary to remark upon how far the latter conception of a cellule diverges from the usual and commonly accepted definition of the word. Hitherto, scientists have understood by the term cellule, a body made up of the union of two essential parts, a quantity of protoplasm and a nucleus. The scientific world argues as to whether elementary forms exist which do not contain a nucleus and which should be termed *cytodes*,\* as proposed by M. Hæckel. The careful observation of micro-organisms by means of perfected technical processes has enabled us to discover hundreds of nuclei in the very cellules which M. Hæckel classed among the cytodes. Such is notably the case with many algae and lower-class fungi. The Moners—a group of micro-organisms believed to have no nucleus—grow numerically less and less, in proportion as they

are more carefully studied. It is true, we are now no more able than formerly, to show the presence of a nucleus in bacteria; but that does not prove that the bacteria have none. Our knowledge of the morphology of microscopic organisms is wholly relative, and depends upon the degree of perfection attained by technical science. When we bear in mind that the presence of a nucleus remained for a long time unobserved in organisms several hundred times larger than the bacteria, we ought not to be surprised at having been unable to discover one in these smaller creatures.

We may even go further, and question the material existence of a body formed solely of protoplasm, basing our opinion upon the experiments of Gruber, Nussbaum, and Balbiani, as reported in my article, and upon the more recent observations of Klebs which are in perfect agreement with the results of the investigators just cited. All have shown that the nucleus is an element essential to the life of the cellule, and that, when a fragment of a cellular body stripped of a nucleus is procured by artificial section, this fragment does not reproduce the organs it lost by being severed; it does not heal its wound, it does not refashion its form, and, what is more, at the end of a certain time its protoplasm, being withdrawn from the influence of the nucleus, suffers complete disorganization. These experiments were made not only upon animal micro-organisms, but upon vegetable cells also. They prove the primordial importance of the nucleus in the cellule and thereby render doubtful the existence of cellules deprived of a nucleus.

Since every cellule contains, in all likelihood, two distinct differentiated elements, the protoplasm and the nucleus, which have neither the same physical structure, nor the same chemical nature, nor the same physiological functions, we may understand that it would be exceedingly difficult to name a single instance of a simple homogeneous cellule. It is the proper place to add that neither protoplasm nor nucleus, each regarded by itself, are homogeneous substances. It is unnecessary to enumerate all the investigations that have been made upon this point. Let us call to mind merely the fact that from the morphological point of view protoplasm appears to be composed of two substances, a homogeneous semi-liquid substance and a firmer substance exhibiting, as authorities upon the subject say, sometimes the form of detached filaments and at others a structure of a reticulate character.

At the present day, accordingly, it is impossible to allow that homogeneous cellules exist, without falling back to Dujardin's theory of the sarcode. There are really no simple organisms, and such as appear so are merely imperfectly known.

However, it will not do perhaps to take literally the terms employed by M. Richet. When he speaks of homogeneous cellules it is possible that he wishes to speak merely of cellules in which, aside from the nucleus, no other differentiated organ is to be found.

Now, it is quite important to note that, even of organisms made up simply of protoplasm and nucleus, the psychology is extremely complicated, and is not contained exclusively in the laws of irritability.

The *Vampyrella Spirogyra*, classed by Zopf among the animal-fungi, and the place of which is still so little known, is a being the body of which is composed of protoplasm and nucleus simply. So far no other differentiated organ has been found in this creature, except from one to four contractile vesicles. Employing the terminology of M. Richet, perhaps we ought to call this being a simple cellule; yet this simple cellule has quite a complicated psychology: it exercises choice in the selection of its food, attacking *Spirogyra* only.

The same is the case with the *Monas amyli*, which, having neither eye nor mouth, represents to M. Richet a simple cellule; still, the *Monas amyli* exercises choice in selecting its food, as it feeds exclusively on grains of starch.

The structural elements of the tissues do not differ from the micro-organisms whose psychological history I have endeavored to

\* From *kivros*, a hollow vessel.

unfold, so much as might be imagined; they show the same powers of selection, and on this point I shall only instance the epithelial cells of the intestines or the phagocyte cells, the attributes of which I have described in my essay, and which are able to discriminate, for instance, between bits of fat and particles of coal, absorbing the former and leaving the latter.

I repeat it, therefore, no living cellule, strictly so defined, is a simple cellule, and I do not think that M. Richet has advanced a fitting illustration in mentioning the muscular cell, for the latter is one of the most highly differentiated that there are.

I cannot imagine, accordingly, to what elements, to what beings clearly defined, we could apply the simple-cellular psychology reduced to mere irritability, that M. Richet asks me to distinguish from the complex-cellular psychology, which would be exclusively reserved for the animal and vegetable micro-organisms that I have described.

It appears to me that this simple-cellular psychology lacks a foundation; it is a conception of the mind, rather than a study based upon observed facts.

In M. Richet's book I find no indication as to what sort of beings he means to distinguish thereby. He contents himself (pp. 20 and 27) with speaking of simple beings without otherwise defining them. Towards the close of his remarks upon my work, M. Richet cites an instance of simple beings, viz., the bacteria; in his judgment, chemical irritability appears to be the sole law conditioning their movements. What are the movements of the bacteria, he asks, if not an affinity for oxygen; in other words, the simplest and most universal chemical phenomenon that exists in all nature?

In our judgment the latter phrase is to be taken metaphorically. We believe that as yet no one has demonstrated that the movements of a living being, in moving towards a distant object, however simple they may be, can be explained merely by a chemical affinity acting between that being and that object. It is certainly not chemical affinity that is acting, but much rather a physiological need.

In fine, let me conclude by saying that homogeneous beings having a simple psychology do not exist, and that wherever observation leads us, we see complex cellules with a complex psychology.

The term irritability, though now so long in use, does not seem to me to be one of the best, inasmuch as it is extremely vague. If it is to signify merely the property of responding to an excitation, it is plain that under that definition we may classify the highest form of psychology,—for all psychological phenomena are responses to excitations; on the other hand, if its sense be limited to mean a change in the form of a cellule when subjected to an excitation, it at once becomes evident that irritability cannot represent the psychology of any living creature sufficiently known and studied.

Psychic life, like its substratum, living matter, is, when closely studied, an exceedingly complex subject. This fact is, with me, a profound conviction; it rests, not upon abstract ideas and methods, but upon the observations that I have given, observations that are not founded upon my own personal authority alone, but which are drawn from the highest authorities, and most of which I have been able to verify with my own eyes.

ALFRED BINET.

## CORRESPONDENCE.

### MRS. M. M. E. ON MARRIAGE TIME-CONTRACTS.

To the Editor of THE OPEN COURT:—

It seems well to notice the criticism by Mrs. M. M. E. of my proposition, not because its points have not been considered and provided for in the latter, but because it represents a good deal of current thought on the subject, not only among a certain class of women, but also on the part of a few men. The views of this criticism

are both one-sided, and also self-contradictory, and they only confirm the statement with which I opened the article referred to, that it is difficult indeed to speak or think rationally on the subject.

In the first place, there are five conditions to be satisfied by a sufficient matrimonial system, only one of which is considered by Mrs. M. M. E. For the other four she makes no provision. She thinks only of the good wife whom a "recreant" husband desires to leave. But what of the good wife who wishes to be rid of a brutal husband; and of the good husband who has nursed a viper in his bosom; or of the two people who mutually desire separation; or finally of the good man whom a woman wishes to desert? The good man in the last case would be apt to let her go, so that this case reinforces the other three in favor of separation, where but the one case which is described by Mrs. M. M. E., seems to render it a hardship. If the woman in this case were as wise as the man in the corresponding one, she also would bid her "recreant" spouse god-speed, and straightway look for a better. But it must be remembered that few whims and caprices survive five years, and that a conclusion reached after so long an experience is apt to be warranted by the circumstances, even in the mind of a man. It must be remembered also that neither party can do it again. Lastly, if the man marries again, as he probably would, one woman would be out of the field, as before.

When we come to Mrs. M. M. E.'s remedy, we find the usual inconsistency of this one-sided view. It is nothing less than "to make divorce optional;" in other words, to abolish all legal safeguards to the family. From being a defender of the family against the changeable temper of the man she begins to doubt whether the family is not the enemy of progress. Thus it is that the attempt to harmonize these two mutually exclusive extremes is often made. The fact is, that under "optional divorce" the situation of women would be much worse than under the time-contract system which I have suggested. It would suit the convenience of men, if they had nothing but their temporary convenience in view; but for most women, it would be ruinous. In view of this surrender of the whole case by Mrs. M. M. E., it seems hardly worth while to discuss the question of support which she raises. She does not mean, I suppose, that a woman should have alimony every time she made a voluntary divorce. This mode of accumulating a fortune is not entirely unknown however, as it may be remembered that a case of this kind came to light in New York City a few years ago.

There is a class of women who forget that they are, like men, subject to the vicissitudes of natural law, and that like men they must suffer more or less, and that nobody is to blame. Men find it necessary to avoid giving offence to powerful rivals, to submit to stronger forces, and to endeavor to succeed in their careers by attention to the nature and character of the men with whom they have to deal. The women who pursue the same policy in their leading occupation, matrimony, generally meet with success in it; but if after a fair trial they find the conditions too severe they ought, like men, to have the opportunity to emigrate. If a woman is incapable of a reasonable amount of child-bearing, she is in the position of the man who is incapable of making a living for a family, with the advantage over the man, according to the five years contract, that she can escape from her difficult position. There is an evident indication in the language of my critic of a misapprehension, common with a limited class of women, that the support of a family is a sort of holiday amusement for a man, while the bearing and care of children is a burden grievous to be borne by women. It is probable, however, that the pleasures and pains of family life are really very equally borne by the sexes, or would be were the natural terms of the contract observed, as I have stated them. Each pays for what he or she gets, and is contented and happy in so doing, provided they do not take too much thought for "untoward events which never happen."

The practical solution of the question is to be found in a system which will give the greatest amount of individual freedom, consistently with the two necessary conditions of all intersex contracts; viz., support for the women and children and definite paternity for the man. The conditions of this contract are fair, and should be enforced so long as the contract lasts; but opportunity should be given to dissolve it in case its conditions become unbearable or impossible. All other considerations are issues aside of this leading proposition. If the divorce laws and courts could meet the case they would be sufficient; but it appears to me that they cannot. For ordinary misdeameanants they are sufficient, but for the best people, against whom no infraction of law can be alleged, they are useless. The causes of marital unhappiness come under two classes, viz.: pure cussedness and natural incongruity. For the former our laws furnish a partial remedy; for the latter none at all. It is my conviction that a time-contract system, together with divorce courts and laws, will be ultimately adopted, although the details may differ from those which I have suggested.

I suspect that we will never return to the system of "matriarchy," lauded by Mrs. Mona Caird, at a safe distance of time and space, unless in the case of an adventurous few, who may have to learn over again what experience has already taught. Matriarchy was, so far as can be determined, simply a prostitution in which the temper of the people did not require the mother to conceal the evidence of her position. Instead of foeticide, female infanticide was practiced, and so was established a system which has its legitimate successor in the prostitution of modern ages. E. D. COPE.

#### NOTES.

Mr. John W. Chadwick, in his printed sermon upon "Robert Elsmere," says: "To reconceive the Universe and Man and God,—this is a much greater, grander task than 'to reconceive the Christ.' But this and no other is the task appointed for our time. And the means for its accomplishment are barely mentioned in the pages of Mrs. Ward's delightful and inspiring book. Literature and philosophy and history are her intellectual lines, and they would seem to have fallen for her in pleasant places. But there is another line. It is that of science. And it is mainly upon this that those are working who are endeavoring successfully to reconceive the Universe and Man and God."

We are in receipt of an excellent little book, "Elementary Text Book of Physiography," by W. Mawer, F. G. S. London: John Marshall & Co. Mr. Mawer is the editor of *Life Lore*, which has been started of late and, as before stated in THE OPEN COURT, contains most interesting articles on the many topics of natural science.

In answer to several queries respecting the translation of Kant by Max Müller, we will state that the publishers are Longmans, Green & Co. of London. Price, with Introduction by Noiré, occupying a separate volume, \$8.00.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXVIII

"No one can entirely free himself from the ideas of his circle," replied the Professor, courteously. "A century ago there was the same tormenting eagerness about rank and social precedence among the citizens. With us it has become different since our life has been pervaded with a strong intellectual element. In the future, even at Court, people will laugh at these things as antiquated frippery."

\* Translation copyrighted.

The Princess raised her little finger threateningly. "Mr. Werner, that was spoken again as the learned man: it was not polite. For, though we move entirely in the track of fashion and of Court manners, we do not remain behind those from whom we are socially separated."

"Perhaps it is because you separate yourselves," said the Professor. "The warmest pulse of our nation has always been in the middle class; from them education and new ideas have gradually spread to the princes and the people. Even the peculiarities and weaknesses of the civilization of a period rise to the throne generally half a century after the educated middle class of the nation have suffered from them, and are only just appreciated there when they are already giving way among the people to some new tendency of the time. Therefore, it is often difficult for the Sovereign and his people to understand each other."

"Oh, how right you are!" exclaimed the Princess, drawing nearer to him. "It is the fate of princes, the misfortune of us all, that the most valuable culture of our time seldom exercises a good influence upon us. There is a want of fresh air in the atmosphere in which we live, we are all weak and sickly. All who approach near us must accommodate themselves to our prejudices, and we accustom ourselves to regard men according to the rules which we have devised for them ourselves. Have you ever before been brought into contact with any of our great rulers?"

"No," replied the Professor.

"Have you never sent what you have written to any of them?"

"I have had no occasion to do so," replied the Professor.

"Then you are unacquainted with the scale of favors that are shown to you learned gentlemen. Now, I must repay you for the delightful instruction you have given me about ancient vases, by giving you some instruction in return. Sit down opposite to me. You are now my pupil." The Princess leaned back in her chair, and assumed a serious expression. "We assume that you are pious and good, and look up respectfully to the handle of the Imperial globe that we hold in our hand. Your first presentation comes,—a handsome book; the title-page is opened: 'Upon antique vases.' Hm—who is the man? One informs oneself a little about the fellow, and it is well if your name is already to be found in print. Thereupon follows an answer of acknowledgment from the Council, short variations according to formula No. 1. Your second presentation makes its appearance: a beautiful binding, an agreeable impression, therefore a warmer acknowledgment in courteous expressions, according to formula No. 2. A third presentation: again a large volume, the gilt edges are unimpeachable; the Council

take the book up and weigh it. If the author is a lesser light, he enters the class of gold breastpins; if he is worthy of a higher consideration, from a well-known name, and what is more effective with us, from a title, he reaches the sphere of orders. There are different classes of orders which are distributed among strangers, accurately according to their titles. But he who is persistent, and does not tire of showing fresh marks of respect, hops gradually, like the green frog, at intervals of years, to the highest rank."

"My kindest thanks for the instruction," replied the Professor. "I must be allowed in this case to take the Council under my protection. For what could the illustrious gentlemen do when they are overrun with such a multitude of indifferent presents?"

"It was a fair example," said the Princess, "of how beautifully we have arranged, in all directions, the steps to our favor. For the rest, we are, with respect to what we accord to people, not only civil, but economical. He who has no colored ribbons to give, finds himself greatly inconvenienced. But," continued she, in a changed tone, "in the same way our principal efforts in every undertaking are made with an eye to vain show and empty forms; and as hundreds are so weak and abject that they are attracted in this way, we think we can thus attach millions to us."

"Many small advantages may be obtained in this manner," replied the Professor; "but there is an error in your reasoning; he who tries to attach men to him by their weakness, vanity, and pride, does not gain the best part of their life. In quiet times this attraction is unnecessary, and in times of danger it has only the strength of a rope of sand."

The Princess nodded her head.

"We know that right well," she said, confidently; "and we do not feel comfortable and secure, in spite of the profuse distribution of honors. What I tell you would sound like high treason to my illustrious relatives, only because I express it, not because I think it. Do not consider me the black sheep of the flock; there are wiser people than I who in secret form the same judgment; but we cannot find our way out of the barrier, and we cling to it, although we know that the support is weak. For as the humming-bird gazes on the serpent, so do we view the prospect that the present age opens before us, with a shudder and helpless expectation." She rose. "But I am a woman, and have no right to speak with you upon these important subjects. When I feel uneasy I use the right of women—to complain—which I have done abundantly to you. For I have it at heart to please you, Mr. Werner. I wish you to consider me as a woman who deserves something better than complaisant words and polite nothings. Allow me often the pleasure of rectifying my judgment by yours."

She put out her hand to the learned man with hearty confidence. Werner bowed low, and left the room. The Princess looked after him with a pleased expression.

The Professor went fresh from the conversation to the pavilion, and told his wife all that had passed.

"I did not consider it possible," he exclaimed, "to find a woman of this rank with so liberal and high-minded an understanding of her position. What was most charming was her animated and unaffected manner—a charm that made itself felt at every moment, both in voice and movement. I am enchanted with the little lady. I will immediately prepare the book that she wished for."

He seated himself at the table, marked out passages, and wrote remarks on small strips of paper, which he laid within.

Ilse was sitting by the window, looking at her husband in astonishment. It was no wonder that the Princess pleased him. Ilse herself had with the quick intuition of a woman perceived her power of attraction. Here was a soul that, amidst the constraint of her Court, longed for intercourse with a man of liberal culture; here was a powerful mind that rose above the prejudices of rank,—clever, light of fancy, and quick of comprehension. Now this woman had found a man to whom she could look up, and with her little hands she cast her fetters about him.

The room was becoming dark. Felix was still sitting writing and making notes. The rays of the evening sun shone upon his head, but the dark shadow of the unfamiliar room hovered over Ilse. She rose from her chair behind her husband.

"He is good to me," she said to herself; "he loves me, as one always does the person whom one has taken into confidence. He is not like other men; he will not allow a stranger to take away my rights; he is innocent as a child, and does not perceive the danger that threatens him and me. Take care, Ilse, not to awake the night-wanderer. I, fool! What right have I to complain if another should benefit by his rich mind? Have I not enough for myself in the treasure of his life? No," she exclaimed, and threw her arms round her husband's neck; "you belong to me, and I will have you entirely."

The Professor raised his head, and his look of astonishment brought Ilse to her senses.

"Forgive me," she said, feebly; "I was thinking."

"What is the matter, Ilse?" he asked, kindly; "your cheeks are hot. Are you ill?"

"It will pass over; have patience with me."

The Professor left his book, and occupied himself anxiously about his wife.

"Open the window," she said softly. "The air of the close room feels heavy to me."

He was so tenderly concerned about her that she again looked cheerfully at him.

"It was a foolish weakness, Felix; it has passed away."

#### CHAPTER XXIX.

##### TWO NEW GUESTS.

The Professor was standing with the Chamberlain and the Sovereign in the study. The latter held in his hand the memorial that Werner had prepared respecting the new catalogue of the museum.

"Only now can I form an estimate concerning the extent of the catalogue which you consider necessary. I am ready to agree to your proposals, if you will bind yourself to undertake the superintendence of the new arrangement and of the catalogue. If you cannot do us this service, everything must remain as before, for only the great confidence which I have in you, and the wish to keep you here, will induce me to make the necessary sacrifice. You see I make the undertaking dependent upon the degree of inclination which you yourself have for this work."

The Professor replied that his presence might be desirable for the introductory arrangements, and that he was ready to spend some weeks upon it. Afterwards, it would be sufficient if from time to time he examined the progress of the work.

"With this I shall be content for the present," said the Sovereign, after a pause; "our contract is, then, concluded. But I see that it will be necessary to get some one who will carry out the details under your guidance. Will the Curator be able to it?"

The Professor thought not.

"And could you propose any one?"

The Professor thought over the old members of his circle.

But the proper man at once occurred to the Chamberlain.

"Would not Magister Knips do for this work?"

"Just the man," said the Professor; "industry, knowledge, everything about him, makes him peculiarly adapted for it. I believe that he may be had at once. I can answer for his trustworthiness with respect to the care of objects of value. But I cannot take this responsibility upon me without disclosing to your Highness that once in his life, from want of caution, he was implicated in a disagreeable affair, that lessened the confidence, not only of myself, but of many of his acquaintances."

The Professor then related, with forbearance towards all concerned, the history of the forged parchment sheet of Tacitus.

The Sovereign listened with interest, and pondered.

"With respect to the safety of the collection, the

old catalogue will allow of constant control. You consider the Magister innocent of this deception?"

"I do consider him so," replied the learned man.

"Then I request you to write him."

Some days afterwards Magister Knips entered the capital. He carried his travelling-bag and hat-box to an unpretending inn, at once clad himself in the dress which he had always spoken of to his mother as his livery, and sought the Professor at the Pavilion. Gabriel saw the figure in the distance passing through the blooming shrubs, his head on his shoulder and his hat in his hand; for Knips considered it proper to uncover his head in the sacred precincts of the castle, and entered like a walking bow into the distinguished horizon. The Professor could not conceal a smile when he saw the Magister in courtly attire, polished and fragrant, standing before him, with two low obeisances.

"It was the Chamberlain who proposed you for this occupation, and I did not object to it. For on the supposition that you will be suitably remunerated, an opportunity for work is afforded which may perhaps raise you for good above your insignificant occupation, and which, if dutifully carried out, will entitle you not only to our warmest thanks, but to those of the whole learned world. Your conduct here may therefore be decisive for the rest of your life. Remember, also, every hour, Mr. Magister, that you have to show conscientiousness and fidelity, not only to learning, but also with respect to the property of the prince who has called you to this post of confidence."

"When I read the letter of the right honorable and most highly respected Professor," answered Knips, "I did not doubt that his kind intentions were to give me the opportunity of assuming a new character in life. Therefore, upon entering the portals of an unknown career, I entreat with deep emotion, above all, for the continuation of your good opinion, which I trust to be able to deserve by faithful obedience."

"Very well then," concluded the Professor; "announce yourself to the Chamberlain."

The day following Knips was sitting before a row of antique lamps, with brown Holland sleeves to preserve his dress coat, his pen behind his ear, surrounded by the books of the castle library; he opened them, compared, wrote, and was as active in his work as if he had all his life been a clerk in a bric-a-brac establishment of ancient Rome.

The Chamberlain announced before dinner, with satisfaction, to the Hereditary Prince, "Magister Knips has come;" and the Prince repeated to his sister, "The wise Knips is here."

"Ah, the Magister!" said the father, with equal good humor.

(To be continued.)

## BOOK REVIEWS.

PHILOSOPHIA ULTIMA; or, Science of the Sciences. Vol. I. By Charles Woodruff Shields, D.D., LL.D. New York: 1888. Charles Scribner's Sons. Chicago: A. C. McClurg & Co.

Professor Woodruff Shields proposes in this volume an academic study of "Christian Science," in which he attempts "to blend more harmoniously together those two general bodies of learning, the scientific and the religious." It is the same object as that of *THE OPEN COURT*, but how different are the methods! The Professor has not yet dropped his theological view that "the personality of a first cause is at once conceivable, cognizable, and scientifically probable." He believes in a "perfect reconcilableness of the whole theology and theodicy with any true metaphysical and ethical theory of the world."

We heartily sympathize with the endeavors of the author to reconcile Religion with Science. He correctly states: "Were true science combined with false religion, or the true religion with false science, the only result would be their mutual degradation and degeneracy." Lowell says:

Science was Faith once; Faith were science now,  
Would she but lay her bow and arrows by  
And arm her with the weapons of the time.

An example from astronomy illustrates the professor's method. He says: "In the starry heavens the scientific observer discovers illimitable matter and force disposed throughout space and time under fixed mechanical laws; in other words, a department of physics; while the religious observer beholds the immensity, eternity, omnipotence, and wisdom of the one true God; in a word, a department of theology. Now, these different aspects of the same phenomena, these almost opposite views of the same facts, are not only equally true, but equally essential to make up the whole truth in regard to those facts. The one has been most surely discovered by man, and the other as certainly revealed by God, and neither can be surrendered but at the sacrifice or peril of both."

The religious emotion which accompanies our knowledge of the grandeur and harmonious order of the starry heavens, originates when we discover the omnipresence of law everywhere, and when we are impressed with the necessity that we ourselves, being a part of the All, must be obedient to the laws of the universe. The religion of *THE OPEN COURT* is in no need of an express divine revelation which is different from the revelations of Nature.

RUBAIYAT OF OMAR KHAYYAM. In English verse by Edward Fitzgerald. Boston: Houghton, Mifflin & Co.

This remarkable Persian poem has already attained that high and secure reputation which places it beyond the need of the critic's word. The publishers have met a real need and increasing demand for this work by printing it in its present inexpensive and available form, the poem being known to most of us before only in the *édition de luxe*, made doubly interesting and valuable by Veder's illustrations. We have here a biographical preface of Khayyam, and the poem in two translations, one the text of the fourth edition, followed by that of the first, with notes showing the translator's indebtedness to the original.

C. F. W.

THE VIKING. *Elyon A. Barron*. Chicago: A. C. McClurg & Co.

Mr. Barron's reputation and merit as a play-writer is already fairly established and in *Viking* we have a more ambitious literary attempt than he has before given us. This play, written in blank verse, finds its subject in the vast and enticing region of Northern legends. It is well constructed in plot, and has a touch of romantic sentiment in it that lifts it entirely out of the commonplace and worthily sustains the reader's interest to the end. Interest in this little drama is further enhanced by a preface written by Lawrence Barrett, who welcomes Mr. Barron to the company of dramatic writers, and trusts his latest work will secure sufficient attention to warrant its production on the stage.

C. F. W.

A MAN STORY. *E. W. Howe*. Boston: Ticknor & Co.

A peculiar title leads the way to a peculiar story in Mr. Howe's latest work, which is neither so powerful a piece of work nor so well executed as that on which his reputation as a novelist was first established, his remarkable "Story of a Country Town." A Man Story deals with the fortunes of a man who, supposing he is legally freed from the bonds of an unhappy marriage contracted in early manhood, marries a second time a woman in every way suited to him, with whom he lives happily. Then he discovers that the divorce from his first wife is invalid; he attempts to keep the peace and preserve the happiness of the second by dividing his time between the places where the two women live, on the convenient subterfuge of business. The whole truth leaks out at last, and a readjustment of their affairs between the three parties that is satisfactory to all concerned. The plot of the story is not the most pleasing, the literary workmanship uneven, and Mr. Tom's monologue, bearing always on one theme, very tiresome—Mr. Howe ought to compel himself to do more careful, worthy work than this.

C. F. W.

A HANDBOOK FOR PILGRIMS. Compiled by Mary B. Dimond. Chicago: A. C. McClurg & Co.

This little book, showing much daintiness and skill in the publisher's work, is also entitled "Thoughts by the Way," and is written, the title-page further describes, "for those who journey through this fair world on their way to one still fairer." Otherwise expressed, it is a collection of helpful extracts from scriptural and other sources of religious literature, gathered under such different headings, each intending to bear relation to the pilgrim's journey through life, as Morning, The Journey, The Rainy Day, The Day of Rest, Going Home, etc. The collection is a trifle pietistic in character and arrangement, but of sufficient merit to recommend it to many readers.

C. F. W.

THE DEAD DOLL and Other Poems. *Margaret Vandegrift*. Boston: Ticknor & Co.

A collection of poems, adapted in subject and an easy flowing meter to young readers, prettily bound, and making an admirable gift-book for the little mothers of dolls and other denizens of the nursery.

C. F. W.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbott. "The great inspiration of the Nineteenth Century is faith in the ideal unities as possible in fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.  
Christian Propagandism. By Francis Ellingwood Abbott. Price, 10 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.  
Compulsory Education. By Francis Ellingwood Abbott. Price, 5 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.  
A Study of Religion. By Francis Ellingwood Abbott. Price, 10 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbott. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.

Evolution and Religion. By John Fiske. Price, 5 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbott. 100 pages. Price, 10 cents.

Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourne and Prof. Asa Gray. Price, 5 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR & CO., Publishers.

175 Dearborn Street, Chicago.

## The Open Court Clubbing Rates.

The subjoined rates are offered to all who wish to subscribe for THE OPEN COURT and any one of the magazines in the following list. If more than one be desired, they may be obtained through our office at the price stated in the first column, allowing a discount of 10 per cent on all orders amounting to \$5.00 and over. Each periodical sent with THE OPEN COURT for the price stated in the second column. Money must accompany all orders.

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, President.

DR. PAUL CARUS, EDITOR.

The reader will find in *THE OPEN COVER* an earnest, and, as we believe, a successful effort to conciliate Religion with Science. The work is done with due reverence for the past and with full confidence in a higher future.

THE OPEN COURT invites the deliberation and prudence of conservatism with the radicalism of undaunted progress. While the merits of the old creeds are fully appreciated, their errors are not overlooked. The ultimate consequences of the most radical thought are accepted, but care is taken to avoid the faults of a one-sided view.

## THE QUINTESSENCE OF RELIGION

is shown to be a truth. It is a scientific truth (a reality) which has been and will remain the basis of ethics. The Quintessence of Religion contains all that is good and true, elevating and comforting in the old religions. Superstitious notions are recognized as mere accidental features of which Religion can be purified without harm to the properly religious spirit.

This idea is,

FEARLESSLY AND WITHOUT RESERVATION OF ANY KIND,

presented in its various scientific aspects and in its deep significance to intellectual and emotional life. If fully grasped, it will be found to satisfy the yearnings of the heart as well as the requirements of the intellect.

Facts which seem to bear unfavorably on this solution of the religious problem are not shunned, but openly faced. Criticisms have been welcome, and will always receive due attention. The severest criticism, we trust, will serve only to elucidate the truth of the main idea propounded in THE OPEN COURT.

#### RATES OF ADVERTISING.

For Each Insertion, without choice of position, per line,.....						\$ .10

CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

GEN. M. M. TRUMBULL.

In No. 25 Gen. Trumbull has an article on "The Value of Doubt in the Study of History." He shows the tendency of historic writing toward exaggeration and falsehood; and he advises teachers to strengthen the minds of pupils by the exercise of doubt. Much of the history of the late war as written by our famous generals is as fabulous as the legend of Romulus and Remus. It is written by men interested in their own story, and therefore it comes under the suspicion cast upon it by the ordinary rules of evidence. "This war history," says Gen. Trumbull, "is woven out of camp-fire yarns." "Like the feet of Chinese children," he says, "our minds were crippled in infancy, and many of them have been lame ever since. They are not as useful to us as they would have been if strengthened in infancy by the exercise of doubt."

GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Unitarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophic theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are *determined* by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

ERNST MACH.

Ernst Mach (Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch) explains in his essay *Transformation and Adaptation in Scientific Thought*, (in Nos. 46 and 48), one of the most characteristic ideas of modern science—an idea that lies, so to speak, in the atmosphere. "Knowledge," he says, "is an expression of organic nature." The law of evolution, which is that of transformation and adaptation, applies to thoughts just as well as to individuals or any living organisms. A conflict between our customary train of thought and new events produces what is called the problem. By a subsequent adaptation of our thought to the enlarged field of observation the problem disappears and through this extension of our sphere of experience the growth of thought is possible. Thus the happiest ideas do not fall from heaven, they spring rather from notions already existing. From this standpoint the narrow conception of egotistic views disappears. "The person" is comparable to an indifferent and symbolical thread on which are strung the real pearls of life—the ideas that make up the changing content of consciousness. Humanity in its entirety is like a polyp plant; the material and organic bonds of union have been severed, but by this freedom of movement, the psychical connection of the whole has been attained in a much higher degree.

GUSTAV FREYTAG.

Commencing with No. 22 is a philosophic novel by Gustav Freytag. In this refined and interesting story the reader becomes acquainted with some strongly marked personalities, and hears from them some rich and rare philosophy. "What is the object of philosophy?" says Frau Rollmaus to the Professor.

"It endeavors to instruct men in the life of their own spirit, and thus to strengthen and improve them."

In the actions, conversation, and adventures of the characters we see this philosophy guiding, teaching and improving them and us. Here through the easy and pleasant method of novel reading we learn the secret inspiration which produces those wonderful phenomena, which hitherto have been considered the mysteries of life; here we see destiny directed and controlled by law, and all the phenomena of natural and physical life are comprehended as phases of one and the same. This monism or conception of the oneness of all life and all nature pervades all pages of this wonderful work of fiction.

## THE UNIVERSAL FAITH.

A MEMORIAL ADDRESS UPON MR. COURTLAND PALMER

BY T. B. WAKEMAN.

*Mr. President, Ladies, and Gentlemen:—*

One of the weightiest criticisms of our American life and institutions is reported by the late Hon. Elizur Wright, of Boston, from the lips of the poet Wordsworth. In a conversation in which reference had been made to the wonderful progress of our country in population, wealth, and material prosperity, the venerable poet replied: "All that amounts to little; what culture can you have in a country where there can be no class of men of wealth and leisure? With all your products you cannot produce a gentleman." \* Certainly, until some material change is made in our mode of life, which may relieve the great mass of our people from the practical slavery and limitations of business and professional life, one of the greatest acquisitions our country can have, ought to be the few men and women whose happy circumstances have freed them from the greatest evil of life,—the uncertainty of the fearful "struggle for existence."

We are here to cherish the memory and to extend the example and influence of one who was above all things an American Gentleman, and who because of that fact achieved, not only the existence of this Club, but the initiation of a new and a beneficial career, worthy of imitation in our Democratic Republic.

Repeatedly in his works, and especially in his lectures upon the "Aristocracy of Freethought," he has taught the chief use of wealth to be its lesson of how little enjoyment it gives by the satisfaction of individual wants, and how priceless is the blessed leisure which it brings, to accomplish the higher duties, and to lead the higher aspirations of our people. In his view the privilege of being a gentleman was a call, not simply to personal gratification,—as is too often the case,—but to a continuous and business-like devotion

\* The term *Gentleman* was evidently used by the Poet, and is used in this address, in the common acceptance of his day, *viz.*, as a person of good breeding, education, and culture, whose honorable birth and provision in life gave relief from the active following of any business or profession. Thus in legal documents we often read, "John Jones, *Gentleman*," to distinguish him from a yeoman, or business, or professional man. But by comity and social progress the word is now commonly applied in this country, and largely in England, to people who are thought to deserve the title without regard to family descent, or business, or occupation. In this sense *Socialism* dreams that all people may be leveled up to this name, which like *Esquire*, *Mrs.*, *etc.*, are the legacy of the noble distinctions of the Feudal System, now common to all who deserve them.

T. B. W.

to the general and higher interests of social and public life. He felt, therefore, that he was to be as far as possible the independent, just, and fearless advocate and promoter of those views which those not enjoying his freedom could champion only at a fearful sacrifice.

Happy the Republic, could it boast of not a few such independent, cultured, fearless, devoted men! To them only seems to have fallen the final beatitude of the social prophet Fourier: "Blessed are those to whom Destinies equal Attractions."

Such men should be, and let us hope largely are, the higher jury of the Republic before whom its higher interests are tried under the higher laws of evolution and progress by which the stability of the achieved is made the firm base of nobler achievement. Wendell Phillips, a gentleman and a prominent member of this higher jury, has spoken much and well of the "Scholar in a Republic"—of his duties, and his responsibilities. It was given to the Founder of this Club, by word and influence and practical illustration, to reveal, as seldom, if ever has been done, the high calling of a *Gentleman in a Republic*. How courageously, faithfully, usefully, grandly our friend sustained, under the circumstances of uncertain health and social obstruction, the duties of a liberal American gentleman, all classes of our community have gladly borne witness. His noble devotion and disinterestedness disarmed all envy. Those upon whom fortune has smiled less favorably rejoiced that for once her favor had fallen upon one whose chief desire was to extend her blessings to all. Singular was the voice of grief, love, and eulogy which rose from the press and from thousands of all classes at the announcement of his sudden decease. Singular to hear words, such as rarely if ever have been spoken over the form of death, from the greatest orator and Freethinker of our time, Colonel Ingersoll, and also from one of the most devoted and talented of the clergy of our city, Dr. R. Heber Newton. The general tribute to his character and career was that he had been one of the most sincere, honest, and devoted of men. As such he had admirably performed his part, under his circumstances, as a member of that high jury of American gentlemen.

But because he was independent, sincere, and honest, a *first hand* and not a *second hand* soul, he had been compelled to form his own verdict upon the highest

of issues—the Questions of Religion, which the very fact of existence propounds to every mortal man. The value of every human life depends fundamentally upon its answer to these questions.

Let no one for a moment believe that unless these great problems had been truly and nobly solved by our friend, the character and consequent career which has called forth general homage, which has brought us here, which has made this club a fact, would ever have been possible.

Our President has therefore assigned to me as to one our friend was wont to call his "co-laborer" the task, or privilege rather, of saying a few words upon our friend's religious convictions. The first reflection upon this subject then should be that these convictions were the foundation of this man,—for a man more deeply, sincerely, and honestly religious has rarely existed. And because of his independence in every sense of the word, and his exceptional means of information, his ability, honesty, courage, and sincerity, and also because of the general worth and beneficence of his life, the fundamental religious convictions to which he attained upon the evidence of his century are worthy of earnest and careful consideration, especially by those who cherish his memory. Let us then, as the first duty, brush away certain misapprehensions:

Firstly, our friend was not simply a Freethinker, or Infidel, in the ordinary use and acceptance of the term, *and no more*.

He was indeed an Iconoclast, and yet that chiefly because he was the devoted adherent and exponent of what to him was the higher, the Positive, the *Universal Faith*.

The negative side of our friend's convictions has had an undue public emphasis. The impression that he was properly described as an Agnostic and Freethinker only seems to have been widely extended by the newspapers at the time of his death. We were told as a wonder that a Freethinker, without belief in any church or religion, could die as calmly as if going to his rest after a day of toil. One city paper even went so far as to compare his tranquility to that of that glorious *pagan*, Socrates.

The trouble with all statements of this kind is that they are anachronisms and are wholly oblivious of the law of evolution in religion upon which our friend's convictions chiefly rested. They were at best half-truths, the negative half merely, with the affirmative complement suppressed or ignored.

It was true that our friend had ceased years ago to believe in, or to use the religious dogmas, creeds, forms, and symbols of his childhood. He regarded them as superstitions, venerable for their antiquity and their past and even present usefulness to those who may still need them. But in our day and gener-

ation, under the light of evolution, he regarded them as obstructions to all higher religions and general progress. He was not slow, therefore, in remanding them, *for himself*, to the realm of tradition and poesy called mythology.

In his last lecture, the "Mastership of Man," nothing can well exceed the energy with which he denounces the further teaching as truths or facts, of such doctrines as the Creation and Fall of man, Original Sin, the Torture of Hell, the Vicarious Atonement, and Eternal Perdition.

How, after all that evolution has done for us in science, history, and religion, any one who supposes himself to be a gentleman, and therefore a fair and honest man, could continue to shut down this old theologic environment of falsehood, and horror upon the human soul of the Nineteenth Century, entirely passed his comprehension.

Fortunately, unlike poor Robert Elsmere of the current fiction, he had given no pledges to fortune, and still more fortunately he was able to escape from this chamber of theological horrors into the clear daylight of the Universal Faith. He therefore keenly felt, with old Lucretius, that the emancipation of the soul of man from its superstitions was really the great triumph of science, far greater than its material benefits, immense as these have been and are.

He therefore gave to the Liberal Scientists and Freethinkers encouragement and aid, as to necessary co-workers in the cause of truth.

The terrible curse of the nineteenth century seemed to him to be the persistence with which these horrid dogmas of the fifteenth century were still accepted and urged by an immense church-machinery as the very substance of religion itself. The same evolution which to his mind had opened up the Universal Faith seemed to him an open road which should to-day be filled by the *élite* of all civilized peoples.

But though he had outgrown the older forms of Theology as the forms and language of Religion, that growth was itself the result of an evolution of the very substance and reality of religion which compelled for it a higher and a truer expression.

The conviction that the old Theology would not stand the tests of science, was not, therefore, to him in any sense a retrograde step in religious culture. It was in itself an advance, an instance of the great law of progress, which is, that an apparent disintegration or differentiation is, if we have eyes to see it, always the result of a higher integration dissolving the old union and ideas at the call of a higher unity. Thus growth always dissolves the old materials in forming a higher combination. Under this law our friend found the old religious ideas gradually but distinctly enlarging by inevitable steps upward, from the simple

imaginative ideas inherited from our primitive ancestors till they culminated in the one grand Universal Faith of the present age; a Faith which includes all of the stages of past religious history, as so many steps to its own final triumph.

In this way, for instance, he followed the growth of the conception of an Anthropomorphic God until it blossomed out into the modern scientific conception of *The Infinite World*, as the true god in fact,—infinite, eternal, and unchangeable in its laws, yet ever varying in its phenomena. How fondly have we together pondered over this problem of problems, how gladly did we find that Goethe, the wisest of men, had placed the same solution in his *Faust*, that modern Book of *Job*, in the great Bible of Humanity.

In *Faust's* musings on God as an ultimate thought, we find the opening words of the *Logos-gospel* carried to their evolutionary and scientific result.

Says Faust:

It stands written: "In the Beginning was the Word,"  
Here at once I balk, who can ever help me on?  
Impossible that I can rate a word so high;  
Quite otherwise must I translate,  
If by the thought I am moved aught.  
Now it stands written: "In the Beginning was the THOUGHT,"  
Bethink thee well over this first line,  
That thy pen pass not too hastily on!  
Is it *Thought* that works and forms the All?  
No, it should stand: "In the Beginning was the POWER."  
Yet even as this I am writing down,  
Something warns me that by it I can never stand.  
The Spirit aids me, all at once I see the truth.  
And confidently I write: "In the Beginning was the FACT."

Thus the poet gives the growth of the God-idea from the *Word* of Theologic Revelation to the *Thought* of Metaphysics, then to the *Force or Power* of Dynamic Scientists, then to the *actual Fact*, and the laws of facts and things which modern Positive Science recognizes as the world of law and order about us. The world as a fact is the true God; the not *I*, which ever stands opposite to the conscious *I*, and with that forms the equation of conscious existence. Says Goethe again, in substance: "He who rises not high enough to see *God* and *Nature* as ONE, knows neither, and thinks only to sink in a sea of contradictions."

In a similar way we saw the *Personal Historical Christ* enlarged to the *Ideal Christ* or Humanity, the *Synthesis* of the Human Race, the epitome of all human History.

*The Holy Spirit* became the *Altruism*, Love, Sympathy, Charity, which makes that human *Synthesis* possible.

*The Holy Mother* re-appears as womanhood.

*The Hebrew-Greek Bible* extended to include the good and useful of the books of the race.

The *Heaven* imagined above became the *Ideal Heaven* germinating in the heart of man and to be realized in the *beyond*—that is, of the human future on earth.

The *Hells* were seen as the shadows of the evils which obstruct the incoming of this Heaven.

The *Creeds* become the Laws and Truths of science, classified into a Positive Philosophy unfolding and explaining the world around us, and the nature and fortune of mankind on earth.

May these few touches suffice to indicate the study of years by which the childish and limited words of the old faith of tradition and authority gradually expanded into a universal faith resting upon verifiable knowledge,—a solid religion which based human life and endeavor upon what man does or can know, instead of that which man does not and cannot know.

However this change of view may seem to others, to our friend it was the realization of a new and enlarged existence, which made life a blessed fact. It seemed to him that mankind was now just beginning to emerge as once did our savage ancestors, the cave-dwellers or Troglodytes, from earth caves, so now we, from the ancient cave-environment which superstition had built over all mankind. Its roof was the old solid firmament above, its floor the solid earth beneath, and still below was the Hell Stream of fire, while above all reigned a despot God, also "a consuming fire."

A life of terror, cowardice, and prostration was all that was possible to men in that environment. In that terror, darkness and selfishness, human brothers, trampled, persecuted, and wronged each other into misery and suicide.

But science had by the telescopes of Galileo swept that old cave-firmament and its God into Infinity, and brought forth the children of men into "the sun and star-lit hall of earth." The old night-mare of the childhood of the race had vanished. The limited faiths had expanded into the Universal Faith, and truth had brought peace, confidence, and healthy effort as the victory of life.

The fruits of this Universal Faith, this Religion of Humanity, which was the inspiring achievement of our friend's life, naturally sent its beneficence as far as his power or influence could reach.

The blessed leisure of wealth was not to him the occasion of a *nothingarian* dilettantism, of idleness or selfish pursuits of vanity, pleasure, or ambition.

Among its good results was the recognition of the interdependence and relations of all of the faiths and modes of thought as parts of one mighty Humanity—one grand human, progressive whole.

Out of such a recognition, which is one of the tenets of the Universal Faith and of that *only*, he sought to bring into this club a higher spirit, not only of toleration but of appreciation, than had before been found practicable even among cultured people. The spirit in which that effort was made, if still allowed to pre-

side over this club, will ensure a lasting benefit not only to its members, and the society of our metropolis, but to the Republic and finally to the world. That spirit of the human good will give a relation, if not a unity, of sentiment, to the most divergent thoughts and creeds,—will give to them hospitality instead of enmity, will give the amenities of cultivated souls wishing well to each, instead of the old exclusive bitterness of bigotry, exclusion, and persecution.

And what may not the enlarging circle of such an influence and example do in the world?

If the heart is right all is right. That well-wishing heart was the secret of the power of our friend;—for us to continue that power is the surety of success.

He told me at one of our last interviews that he had found the flower of our human Faith in the words of the poet Lowell in memory of the great Naturalist, Agassiz. He wrote them down for me, and from his own hand I read now the best picture of himself: the best ideal for us if we extend it, as he wished and as he did, not only to individuals, but to their thoughts, feelings, creeds, and faiths:

"His magic was not far to seek,  
He was so human; whether strong or weak,  
Far from his kind he never sank or soared,  
But sat an equal guest at every board,  
No haggard ever felt him condescend,  
Nor Prince presume; himself he always bare  
At manhood's simple level, and where e'er  
He met a stranger, there he left a friend."

#### THE NINETEENTH CENTURY CLUB AND ITS FOUNDER.

BY MONCURE D. CONWAY.

A youth went forth in the morning twilight and sat on the summit of a hill, gazing on the slumbering villages below. While he sat there a procession of weird forms passed before him. Out of the realm of shadows they came, into the same they passed, from their vast circuit. Between dusk and dusk their tall, swarthy shapes were revealed by the flaming star which each bore with an uplifted hand. The other hand of each was bent with open palm earthward. Though some of the faces were stern, others were beautiful. Though the youth longed that their eyes should turn towards him, and some word fall from their lips, silently they passed on, each eye bent forward on vacancy. He spoke, but they heeded not; he shouted, but they answered not; at last he wept and implored, and stretched pleading hands, but they returned him no sign.

At length the sun rose: its splendors shot over the earth, and nothing could be seen on the horizon but columns of rose-tinged cloud. From these the youth turned and hastened homeward; but through the day he sat dreaming of his vision, and in the night he could not rest. Ere daybreak he sat again on the summit, and to his joy the genii again appeared. This time,

he thought, they will surely speak to me, perhaps alight on the earth, or at least give me some sign of the errand on which they are bound. But it was not so: still their feet touched not the earth, no star was lowered, nor eye bent downward; the plaintive cries of the youth gained no response, and the morning light again smote the wondrous forms into floating mist.

Day after day, as it was breaking, found the youth speeding from his feverish couch; as its bright hours passed they beheld him tranced in gloomy abstraction; and the night brought out its galaxies only to be eclipsed by the upheld flames of his phantoms. So glided the weeks into months, the months into years. The whole life and heart of the youth were gone out into pallor and pain, as he thought only of the incomprehensible forms. With them went out sweet hopes and joys of those around him. Parent and sister, brother and lover, waited for the return of his affection and interest in vain.

One day, when he had come from his watch, it was told him that one who had formerly shared his love, lay dying. A shudder passed through his frame, as a glimpse of his dead world parted the cloud which separated him from it, then he sank, and lay as if turned to stone. In his trance that loved one stood beside him, and said: "Since thou didst die to me in the land of the living, let me live to thee in the world of the dead. Thou wouldst know the meaning of the phantoms. Listen! Their names are Life, Pain, Thought, Love, Death. They bear stars; for, starlike, they follow their courses, unhalting, unceasing, unswerving. Their steadfast eyes bend not to thee, their ears are deaf to thy cries, because they exist only in their eternal purpose. One sign alone they had for thee—and that, alas, thou couldst not understand: the hand pressed earthward. That would have said, 'As we pass steadfastly on our orbits, bear each our appointed star, fulfilling our task, even so do thou on earth, though thy star be a brief love, thy task a child's happiness.' Whilst thou vainly pleadedst for the secret of Life, its reality was with the butterfly that alighted on thy shoulder, the flower opening at thy side, unheeded. Whilst thou wert pondering the mystery of Pain, thou hast not cared that it was piercing hearts around thee. Whilst dreaming of the source of thought, thoughtless thou hast been; speculating about Love, thou hast shut it out from its rest in thy heart; grasping after the meaning of Death, thou hast made it the fearful guest of thy home."

Then in the grey morning he awoke to dream no more of the phantoms. Beside that bed over which Death was hovering, he watched till he saw the tide of life return, and when health and joy glowed there again, lo! he beheld the face of his fairest phantom, as if turned from its star-track to befriend him. Now,

under white hairs, his youth was partly recovered; he made hearts forget their pain in his songs; his winged hand achieved works for men; for him past dawns lingered in tints of the petal and the shell; the unswerving stars answered him in eyes he had taught to smile. In happy dreams the genii kissed him who had risen to their path by travelling his own with a steadfastness equal to theirs.

\* \* \*

My little fable is that of the world, and of our race. Through dark ages, and ages of long twilight, mankind have devoted first fruits of their humanity—their genius, learning, wealth—to phantasms of the unknown powers; to them sacrificed the joys of earth, its beauty, its peace, even after the slaughter of human victims had ceased. There are human sacrifices where no blood is shed; and they have lasted into our time. Dr. O. W. Holmes recently remarked to me, "I have spent some of the best energies of my life in merely clearing away the bushes to get at real life, and the simple truth of things." That is the experience of one reared at the fountain-head of American culture.

But we witness a change. A generation has arrived which realizes that it does not exist in one world to attend to the affairs of another, and that it has enough to do in grappling with known forces without wasting strength on the unknowable. Emerson said in my hearing, "An actually existent fly is more important than a possibly existent angel." The latter-day pilgrim reverses the "progress" of Bunyan's Christian: he journeys from the life to come to that which is. To some this is a new religion. As the poet Arthur Clough,—whom some are identifying as Robert Elsmere,—wrote:

"It seems His newer will  
We should not think at all of Him, but turn,  
And of the world which He has given us make  
What best we may."

This has long been the consensus of a majority of liberal and instructed minds. But there may be a religion without a gospel. To be a gospel it must baptize its forerunners and messengers with fire; it must attain human incarnation. Some must sell all they have and follow it. It must be beloved as well as believed, and lived, and embodied.

The first autumnal assembly of the Nineteenth Century Club (November 21, 1888) met to commemorate its founder, the late Courtlandt Palmer. It is strange enough,—and this great money-making New York is not unnaturally impressed by the fact,—that one of its old gentry, a society man, a millionaire, should have become the apostle of the new humanitarian faith. The fires of cremation were never more symbolical than when they reduced to ashes so much of Courtlandt Palmer as had not been consumed by his enthusiasm of humanity. I recognized the sacred

fire on him when he laid before me, as a newly chosen officer of the club, his ideas and ideals concerning it. The old social order, he said, advances swiftly to ruin. It rested on beliefs fast failing like rotten beams. The débris is already visible in decay of old restraints and consequent tendencies to anarchy. There are increasing moral and social dangers which threaten all equally—whatever their creeds—and which can only be met by the harmonized activities of all the humane, the earnest, the competent workers in the community. They must be drawn from their sectarian isolation. They must keep their theories, their theologies, but must abandon their bigotries—whether fanatical or radical—and coöperate for human enlightenment and welfare. The Nineteenth Century Club is introducing them to each other. It is much to bring them within hand-shaking distance of each other. We do not ask them to suppress their doctrines, but to be prepared to discuss them, to explain them, and to listen respectfully to the doctrine of others. He expressed his belief that similar clubs would spring up in other communities (already there are one or two such) and that a large humanizing and liberalizing influence would spread from them through the nation. Nay, through the world. During his last visit to Europe Courtlandt Palmer made an effort to establish a similar club in London; he failed only because London is already a vast Nineteenth Century Club, distributing its work in many sections and sub-sections, all meeting in its grand magazines and reviews—such as "The Nineteenth Century."

Our Nineteenth Century Club, seen in its founder's large way, is the legitimate successor of the original clubs. In ancient times, men who consecrated themselves to the salvation of mankind could not earn much money; they could live only by clubbing their small means together in convent or college. The club was the economy of the other-worldly. Its original intent survives to some extent in the English club of to-day, where scholars who do not devote their lives to money, may yet enjoy luxuries at low price. The need of our time corresponding to that which made poor priests and students "mess" together, is the spiritual, the intellectual, and moral need we all have to bring our isolated ideas and energies together, and, by exchanges, participate, without encroachment on each other, in the great banquet of truth and knowledge in our time. And that not for mere luxury, not only for dilettantism (though something may be said for these also), but for a purpose of human salvation as urgent as that which brought the old Black Friars and Gray to their commune. It is a salvation from ignorance, narrowness, from that pious provincialism which is our modern paganism. It is a salvation from the spirit which "evermore denies," and sour discord be-

tween honest men who should be friends and fellow-workers.

The Nineteenth Century Club is not founded to assail anybody's belief, but to humanize all varieties of belief. It is steadily replacing controversies with explanations; the speakers refrain from caricaturing each others' beliefs or unbeliefs. This is not the revolutionary or the iconoclastic method; it may permit the phantoms to go on with their procession somewhat longer, and to maintain their social estates. But the phantoms will have to remain by their benedictions, not their cursings; by charity, and not sacrifice; there will be flowers on their altars, and not bleeding hearts; they will survive by uniting those whom they once parted, as sheep and goats; they will approve themselves not by miracles of blasted fig-trees, but by bearing fruit on every branch for the sustenance and happiness of mankind.

### THE WISH-RING.

AFTER THE GERMAN OF RICHARD LEANDER.

There was once upon a time a poor wood-cutter that had married a good and honest maiden. He was working in a great forest, a day's journey from his native village, and was busied with the felling of an old oak tree. As the noble tree crashed to the earth, there came limping out of a rotten hollow in the trunk an old grամam. She told him that she was a fairy, that a wicked magician had bewitched her, and that the wood-cutter had at last delivered her from her long imprisonment. She wished to prove her gratitude to him and make him a present. There was an eagle's nest in the top of the prostrate tree and in it lay a solitary egg. The fairy took the egg and broke it. A plain ring dropped from it,—a ring of brass: "Take this ring as thy reward," she said, "it looks common and worthless, but it is a wish-ring; wish whatsoever thy heart desires and thou shalt get it. But mark me well: there is but one wish in it!

The fairy gave the poor wood-cutter the ring and vanished.

Any other man would have left his work and made a good wish at once. But Peter—such was the woodman's name—did not do that. "There is no hurry," he said to himself, "and then I must go home first and talk with my wife about it." He faithfully completed his work, and then with a light and joyous heart, wended his way homeward.

On the way, he passed through a great city. It had meantime become evening, and as he walked with firm step through the lighted streets, he saw to the right and left the brilliant and dazzling windows of the shops. At other times he had asked himself, as he saw the wealth of articles on show: "Canst thou pur-

chase this or that?" But to-day he viewed them all with princely pride, as if to say: "I could have them all. I need but to wish it and they are mine. But no! I'll wish me something better."

While thus talking to himself, he paused before the show-window of a jeweler's shop. Ah! how many costly rings there were behind those great panes of glass! The goldsmith stood in the doorway near by, having just quit work. "Well stranger," he said, "wouldn't you like to buy something of me?" And therewith he secretly examined the wood-cutter, to see whether, perhaps, he was able to pay the price of a gold ring. "No, master goldsmith," Peter answered, and turned to him with sparkling eyes. "Look here, this plain little ring on my finger is worth more than all your rings so precious, all your pearls, all your jewels and trinkets!" "It is a wish-ring," he added in an undertone, and told how he had come by it.

In those days—at the time of our story—wish-rings were not uncommon. The goldsmith was a shrewd fellow, and, as he saw that honest Peter was incapable of a lie, he at once believed the story that was told him. But he was greedy and covetous. "I must have that ring," he said to himself, and he called out pleasantly to the woodsman: "Stranger, you are a favorite of fortune. A man like you brings good luck to every man's house. What a pleasure it would be to entertain you! Step in with me, be my guest, and a hearty welcome to you."

Peter suspected nothing wrong and allowed himself to be led into the house by the over-friendly goldsmith. The goldsmith had his maid get a good-supper ready, for the old niggard had neither wife nor child, and brought out his best and heaviest wines for his guest.

Peter was tired from his day's work and his long journey, and had grown hungry and thirsty. At the sight of the good wines that he had never yet tasted in his life he became talkative, and soon after he sank into a deep and heavy sleep. Then the goldsmith pulled the ring from the finger of his guest, and put a common brass one in its place. The next morning, at daybreak, he awoke his guest, got him his breakfast with his own hands, and wished him God speed. Before opening his shop, he went down into the fire-proof vault of his house, put the ring on his finger and said: "Let there rain hard Prussian dollars, ten times one hundred thousand of them." And lo! down from the roof they came, and fell like hail-stones, fast and furious, upon the floor beneath. But many of them fell upon the head of the goldsmith, and he plunged senseless to the ground; still more rained upon him, and he was crushed to death. Down they came still, until there really were ten times one hundred thousand of them. Not a single one was

missing. But the goldsmith lay dead beneath his treasure.

After a while, when the goldsmith did not appear about the house, his maid became frightened and ran for the constable. The constable came, knocked, shouted, and then broke open all the doors. They found the goldsmith at last, buried beneath his piles of great, hard dollars. His heirs came, gave him a grand funeral, and divided his money amongst them.

Now, poor Peter trudged along with his wrong ring, and came to his wife with glistening eyes to tell her of his adventure in the forest. "I tell you, Peter," she said, "we'll wish for those two acres of land we just rented." "Not yet, wife," said Peter; "I've already saved a part of the money to buy them; we'll keep our wish for something better than that." And Peter went to his work fearlessly and trustingly, as though nothing could fail him.

Scarcely was the year up and he stood as his own master on his own ground. "Now, wife," said he, "both the acres are ours, and we've got our wish yet." "Yes," she answered, "and now let's wish for a cow." "No," said Peter, "we can soon save the money for a cow, and I am not going to wish for a thing that I can get so easily myself. I am going to wait with my wish until something extraordinary comes along."

And so it went from year to year. A horse was got, and then another; they increased their stock of cattle and bought more new land. The old cot had become too small for the young folk that were growing up; it was torn down and in its stead arose a handsome farmhouse, for Peter had become the most respected man of his village. His children grew apace, and were all sturdy and true, as was he and his wife. Everything that he laid hold of was blessed; for he went at everything with care and with a will, as though failure were impossible to him. He would often twist the ring on his finger, and when his wife glanced at him with the unasked question upon her lips: "Shall we wish this or that?" a smile would pass across his quiet face and he would say: "It's time enough yet. The ring brings me luck, and the wish—I'll always have *that* left."

And so it went on. He and his wife lived to a great and hearty old age. His children's children were growing up. He had become old and feeble, and one day he fell into a soft and silent sleep from which he never woke again. The shock was great to his wife, so great that she too had to seek her couch, and on the day after, she followed her husband. The venerable old couple were buried together. It was a noble following that marched along behind those coffins, the sturdy, powerful sons and the slender grandchildren, all with their wives and relatives. "And there was that ring," said the eldest "Poor father always had his secret

about that; he must have thought a great deal of it: so we haven't taken it from him."

Thus was the wish-ring buried with its owner, and it was not the real one at that. It had brought a blessing upon him and his house; not because happiness lay in the ring itself, but because that blessing lived in the bosom of its possessor. This it was that brought him happiness. The real wish-ring had brought its unworthy holder the fulfillment of his wish and with it the ruin that his covetousness had invited.

It is a strange thing, this matter of the right and the wrong. A bad thing in good hands is ever so much more valuable than a good thing in bad hands.

\* \* \*

True happiness is a part of our own and innermost nature, and what we commonly call luck and ill-luck, is often but our own fancy deluded by outward show and vain splendor.

#### THE CONSERVATION OF ENERGY IN THE MORAL WORLD.

BY GEORG VON GIZYCKI.

Translated from the German by *μικκ*.

There is also a law of conservation of energy in the moral world. Every man can make those words of Faust his own:

The traces of my days on earth  
Cannot in ages perish!

What a powerful assurance does this thought lend our actions, what a serious and solemn significance does it impress upon life! How it exalts our consciousness of self, how it awakens in us the sense of creative responsibility! And how this thought with its promise of unselfish immortality, works in us as a conqueror of death!

Nothing is lost! The results of our works are imperishable! When once a deed is done, it no longer belongs to us,—it extends its influence, in ever and ever widening undulations, into all eternity, "Our deeds," says George Eliot, "are like children that are born to us; they live and act independently of our own will. No, children can be strangled, but deeds never: they have an indestructible life within, as well as without, our consciousness."

Our deeds have truly "an indestructible life within our consciousness." Our existence is not a succession of disconnected moments (as the doctrine of chance represents it), and we do not at every moment begin to live life over again; yesterday is not indifferent for to-day, nor to-day for yesterday; but our life has continuity and solidarity; every part of it rests beneath the influence of what has gone before and influences what is to come. Every past has sown, every future will reap, good or bad. "The least step towards the bad," says Shaftesbury, "changes the character

and worth of life"; and the same is true of the slightest good deed. Every good deed makes easier those to come, it clears the way for better ones, it gives us a joyous confidence in ourselves, and strengthens our moral power. A bad deed makes better conduct difficult; it shadows one like a destiny, forcing him to continue onward in the path of evil, for it seems that there is no longer a way of return. "Our actions determine us just as much as we determine our actions," says the great poetess whose words we once before quoted. "There is a fearful power in our actions, that can first make a hypocrite of an honest man, and then transform him into agreement with this change of character; for, given the first misstep, the second appears as the only possible retreat and for ever afterwards the best. . . . Europe, they say, adjusts itself to the *fait accompli*; and so it is with the individual man."

Not only our actions, but our feelings and thoughts have their imperishable effects within us. Thence the commandments: Thou shalt not covet what is unjust! and: Be watchful and true!

But there are no actions, no feelings and thoughts, that affect us *alone*: they all extend their influence to others. Whoever injures his own physical and mental health, will thereby injure that of his descendants. "The iniquity of the fathers is visited upon the children unto the third and fourth generation."\* But whoever physically, or mentally, or morally, perfects himself, that person gives happiness to child and children's children. Yet the influence of our conduct does not alone affect our family,—it is, in the strictest sense of the word, immeasurable: it extends far and near, throughout all time. How must this thought exalt and gladden him who strives for the just and good! Could any other thought so much enhance the sacredness of moral obligation?

Perhaps but one: the thought that we alone can work righteousness in the world. The cosmic powers without us do not realize our ideals. If we conscious beings do not help ourselves, then no one will help us. If we do not ourselves help our brethren, then no one will help them. Gods will not help them, nor "time." John Morley has well said: "Mankind does not move onward like the hand of a clock, driven by a mechanism of wheels. It cannot rest for a generation, in the comforting consciousness that it will arise again at the end of thirty years in a greatly advanced condition. The little that we see at all of progress, is effected rather solely by human effort and human work. . . . He who thinks that abuses, absurd customs, life-wasting institutions, will disappear of themselves from the

world, forgets the fact that in most cases the selfish interest of whole classes is closely united with every one of these evils." Generations of men not only grow and flourish, but they pass away. Nations not only move in the path of progress, they decline and fall as well. Each of us can work to that end, that our humanity may not perish. Each of us bears within us a share of the responsibility.

#### THE MEASURE OF TIME.

BY JAMES BUCKHAM.

Life is too serious, filled with crying needs,  
For men to count their lives alone by years.  
The world's great heroes rose through toils and tears;  
They wrote the mighty sum of life in deeds!

#### SONNET.

BY LOUIS BELROSE, JR.

Ere the first rose, which bloomed when first we met,  
Gave fruit of flowers to a warmer sun,  
Ere Time, that tends the work by Love begun,  
Rolled back the leaves wherein her soul was set,  
This lady, now my fond heart's floweret,  
Remained unknown to me. She seemed like one  
Unworthy love, but whom we gaze upon  
Delighted for an hour and then forget.  
Even so she seemed who now appears to me  
But with her soul, that draws my own above  
Remembrance of her beauty's mastery;  
Only her dear, sweet soul, the light whereof  
Was lighted that my guiding star might be  
None other than the purest flame of love.

### BOOK REVIEWS.

LES PRINCIPES DU DROIT. *Emile Beausiire*, Membre de l'Institut.  
Paris: 1883. Felix Alcan.

Both in philosophy and jurisprudence the distinction between law and ethics is of recent origin. The philosophers of Greece overlooked it, the jurists of ancient Rome blended the two ideas in their universal science—the cognizance of things human and divine,—while for scholasticism the principles of jurisprudence were a part of theology. Puffendorf limited the *jus naturale* to outward acts, cognizable before the courts of man and not before the tribunal of God. Leibnitz like the jurists of antiquity, conceived the existence of a universal jurisprudence, comprising the justice of God and man, and finding its culmination in a future life. But it was not until Kant that the distinction was clearly indicated. Having posited in the Critique of Practical Reason, the underlying principles common to both sciences, he proceeded in two separate works to develop the formal elements of each. The limitation of the domain of natural law to outward acts was made the basis of a careful philosophical analysis, and the starting-point of an ingenious and profound formulation of the principles determining the respective provinces of jural and moral science.

While the distinction is now generally emphasized, it has borne fruit more quickly in the province of ethics than in the domain of law. The practical conclusions of ethical science rarely meet with opposition. Few call that a vice which others denominate a virtue: while many advocate as a right what just as many others denounce as unfounded either in the philosophy of nature

\* Compare Th. Ribot, *L'hérédité psychologique*, II. Ed. Paris: 1882. Ier Partie, Chap. 5; *L'hérédité des sentiments et des passions*, IIIème Partie, Chap. 5. *Les conséquences morales de l'hérédité*.

or the common experience of mankind. Upon the question of rights philosophers and jurists are divided. Anarchy prevails in the world of opinion touching the rights of mankind—and not because fixed principles are not admitted as maxims of conduct, but because these principles are not recognized as universally necessary and permanently requisite to the regulation of human laws. To dispel the confusion that thus reigns in the metaphysics of jurisprudence, and to attempt a philosophical exposition of the formal principles of jural science, has been the object proposed by M. Beausserie in his work upon the "Principles of Law."

"A single concept suffices to constitute law—the concept of duty. The idea of duty is borrowed from ethics; but the law accepts that idea complete and does not seek its origin. Duty is to law what space is to geometry. The task of going beyond duty the law leaves to ethics as geometry leaves to metaphysics the task of going beyond space." In this principle M. Beausserie finds the basis of his science. The development proceeds from an introductory discussion of the "state of nature," the "social contract," and of like hypotheses that adhere to the body of philosophic jurisprudence, to the division and analysis of the various jural ideas controlling the legal systems of civilized society. The propositions advanced appertain to no one community; the analyses offered rest upon the principles of no one system of law; but a presentation—in so far as that is possible—of the formal principles, the metaphysics of law, founded upon the basic idea of duty, is attempted. The book thus forms a proper introduction into the study of jural principles, whether for the student of law or the student of philosophy. In the method of such works lies the true foundation of a balanced legal culture.

That method is strangely opposed to the one obtaining in our country. On the continent the study of law is preceded by a survey of the formal principles of jurisprudence, whether it be through the medium of a work like that of M. Beausserie, or through the study of the more universal and equitable polity of prætorian Rome. But the pride of our jurists glories in the independence and indigenous character of our system of jurisprudence,—and they can conceive of no other scheme of instruction than the media-voc-historical method. Yet the pretension to an autochthonous origin is in the main unfounded. The influence of civil doctrines upon the Chancery, Admiralty, and Ecclesiastical Jurisprudence of the Anglo-Saxon nations is undeniable; the infusion of civil principles into the body of our commercial law is extensive and controlling; legislation bearing upon the law of marriage and the relation of the family to society is being constantly made to harmonize with the equitable notions obtaining in the time of Justinian; and the constant tendency of juridical methods is towards a recognition of the more universal principles developed by the prætors and jurisconsults of Ancient Rome. The code of Louisiana, the customary law of Lower Canada, are derived from the civil law. It constitutes the basis of the unwritten law of Continental Europe. In the colonial settlements of Java and Japan, in Ceylon and in Trinidad, in the East and West Indies, in South America, in Mexico, the basis of the dominant systems of unwritten law rests on the theories of the Roman jurisconsults. In the words of D'Aguesseau "the grand destinies of Rome are not yet accomplished; she reigns throughout the world by her reason, after having ceased to reign by her authority." Yet in the face of this universal influence the study of Roman jurisprudence, with few exceptions, finds no place in the curriculum of the Anglo-Saxon legal education. The introduction into the great body of legal truths is made through the medium of a work, which, however grand in method and execution, rests upon the erroneous assumption of a theocratical ordination—a work whose only worth must now be found in its value as a source of historical inquiry and as a classic specimen of English prose and juridical rhetoric.

REALISTIC IDEALISM IN PHILOSOPHY ITSELF. *Nathaniel Holmes.*

Boston: 1888. Houghton, Mifflin & Co. 2 Vols.

"Realistic Idealism holds that the Real and the Ideal are not two distinct worlds, but only the two sides or aspects of one and the same whole. Actuality of real Essence and Power. The theory is founded, as the universe itself eternally is, upon absolute and relative necessities, movable and immovable grounds, essential and changeable relations, the logical categories of reason, of freedom and necessity, universal and necessary truths, and absolute Fact. Its method is both analytical and synthetical, is neither exclusively dialectical and deductive, nor wholly experimental and inductive, but is both at once: it is, in short, the universal method of the Metaphysical Logic which takes up all science into intelligible and clear solution. It begins with Psychology and ends only in Ontology, or the Science of all real Being. The analysis finds its completion and absolute synthesis in the identity of the Real and the Ideal. Its Logic is grounded on these eternal necessities, absolute truths, essential and necessary relations, universal categories of necessity and freedom, and the universal and necessary fact of eternal movement on the basis of the immovable or the unmoved, and the instrumental mediation and reflection therein necessarily involved; and that are, all together and in the complex unity of the synthetic and absolute Whole, necessarily constitutive of pure universal Reason or absolute Intelligence, and of all Reality. Its summary category is that of Universality, Speciality, Particularity, and Totality or One-Wholeness. Freedom is mere possibility, and as such is an absolute fact; a truth that is as eternal and necessary as any other necessity of Reason. Universal Movement is the same thing as Self-movement, and is an absolute fact and a necessary truth as such. The universal and essential Whole, as absolute Content and Form in eternal movement, is eternally and necessarily differentiated, distinguished, and distributed into parts, aspects, and special relations within the Whole; and the eternally active and absolute Causality therein involved is eternally and necessarily mediated through these special determinations of essence, form, and relation, as media, means, or instrumentalities, and further differentiated into other specialities of essence and form, and into the particular substances, shapes, qualities, and properties of things in Nature; returning again through them and out of them into its own ever-continuous identity, whereby they vanish as such in a perpetual round or cycle of creation of new in the destruction of old. Such movement in Freedom and under all the categories of Necessity and Reason is thereby necessarily a rational process of change in the movable on the ground of the immovable, and is, in short, an eternal process of absolute Knowing and Creating. Knowing, or Thinking, is nothing else but that. Consciousness is the simple fact of knowing, and is nothing else but that. Such knowing, conscious movement is Will, and Will is nothing else but that; and Will is only partially (not absolutely) free, and is only partially (not absolutely) necessary. Some limited degree and measure of purposive self-determination to a definite end and aim is both possible and actual therein. Fully defined and correctly conceived, the universal and absolute Intelligence is found to be identical with the absolute logical Notion, Concept, or Idea of all Reality and all Ideality. Nature is the external aspect and manifestation of the continuous evolution of the universal, eternal, absolute, and ever-identical Whole into special and particular parts, aspects, and things, which are as permanent as they are permanent, and as evanescent as they are evanescent, existing as real only in the ever-flowing Ideality of the eternal Reality. Finite souls, in whatever degree, from the lowest self-conscious animal up to the highest human intelligence, are such specialities of essence and form, of soul and body compounded, in the sphere of external Nature; the internal soul being so specially constituted within the external body as to be in itself a special whole by itself considered, and a *quasi* logical Notion (however incomplete), and, as such, a partial and

dependent (not an absolute) unity or syllogism of synthetic Apperception and Judgment in a finite personality, sharing as such in the universal reason and life by a certain limited participation therein, and so being itself a special knowing, thinking, and creating power, under a special consciousness of its own, endowed with a certain limited free agency as knowing will or conscience, and capable of imposing law, guidance, and control on its own action and conduct, and of a certain measure of moral responsibility."

Such, in the words of the author, is the philosophic theory of Realistic Idealism—not remarkable for its lucidity. We are struck, we must confess, by the opacity of purpose pervading the work, and we think the presentation would have been much more effective, had the author, as he confesses he has not done, "contented himself with a rigid and exact statement of his own conclusions in the briefest form possible." Philosophy, it is true, is a "criticism, an eclecticism." But it is the eclecticism of ideas and not an eclecticism of theories literally transcribed with a painful affectation of artificial terminologies. We feel that Realistic Idealism in Philosophy itself is encumbered by its method, and that, though interesting in parts from the standpoint of the history of philosophy and by reason of its copious citations from the literature of ages, it cannot be regarded as having greatly contributed to man's "aspiration after an intelligible theory of the universe and himself." *μικρο.*

In the January number of *The Atlantic Monthly* Mr. Thomas Bailey Aldrich has published a poem on the Gloucester fisher folk, "Alex Yeaton's Son." Mr. Aldrich will contribute to the January *Scribner's* some bright memories of Portsmouth, N. H.

The New York *Evening Post* calls attention to Mr. William George Spencer's little book "Inventive Geometry." The author (father of the distinguished philosopher) has carefully graded and arranged his problems so as to impart to the student an increasing interest. Classes formed for testing the value of the work, we are told, proved extraordinarily successful. The book is published by Messrs. D. Appleton & Co., New York.

We welcome *The New Ideal*,—the successor of *The Index*,—to the field of modern progressive thought. The constructive method it proposes will undoubtedly contribute to its success. The editor, Mr. West, is the author of "The Complete Life," "Uplifts of Heart and Will," "Voices of Youth,"—earnest and thoughtful productions. The contributors, including many of *THE OPEN COURT's*, are all well-known. Liberal journals which do not rest satisfied with the negative views of Agnosticism are wanted, not only one or two, but many, and a healthy competition among them should arise, to bring to their readers the best, the purest, the ripest thought of our age. The more competition we have of that kind, the more such journals will prosper. The field is large and the harvest is great—but alas, the workers are few. We hope, and do not doubt, that *The New Ideal* has come to stay for good and will answer the need of the time.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XIX.—Continued.

The same week the Sovereign was taken by the Chamberlain into the museum, in order that Knips might fall under his notice. The Sovereign looked with curiosity upon the lowly bent man, who perspired with fright, and who now quite resembled a mouse which is prevented by a powerful fascination from disappearing into its hole. The Sovereign discovered immediately what he called a subaltern nature; and the pale flat face, retreating chin, and dolorous aspect,

appeared to amuse him. In passing, he remarked the rampart of books from which Knips had emerged.

"You have made yourself quickly at home; I hope that you will find all the books that are indispensable to your work."

"I have ventured," said Knips in a high and rasping voice, "to borrow from your Highness's library much that I needed. My wants are moderate, and what I lacked, I have managed, through the assistance of honored patrons, to obtain from the university library of my native city."

The Sovereign answered with a short nod, and proceeded. Magister Knips remained standing in an attitude of deferent respect till the Sovereign had left the room, when he returned to his chair, and, without turning to the right or left, resumed his writing. Whenever the Sovereign entered or left the room he started up and sank down again, as if turned into an automaton by his great respect.

"Are you satisfied with him?" asked the Sovereign, of the Professor.

"Beyond expectation," answered the latter.

The Chamberlain, pleased by his recommendation, reminded his master that Knips was also an excellent painter of coats of arms, and possessed remarkable knowledge of the customs and regulations of the old Court festivals.

When the Sovereign left the gallery he cast a dignified glance over the bent head of the little man; but Knips might well be pleased with the results of this presentation, for he was pronounced very respectful, and regarded useful for further projects.

He had soon an opportunity of showing his usefulness in an extraordinary case. The arrangements of the Court were in every respect exemplary, and not least when the Sovereign wished to show some mark of attention. A confidential councillor kept a list of the birthdays on which the Sovereign was bound to make a present, and also of the popular festivals where it was necessary for him to present a silver cup or some other testimony of his royal sympathy. On this list was noted down the fixed value of the present; and as the time approached the councillor sent the necessary information to the Chamberlain, whose business it was to choose a suitable present. On the birthday of any member of the princely family the Chamberlain only made suggestions; the Sovereign himself decided what was to be given.

Now the birthday of the Princess was approaching. The gentleman-in-waiting, therefore, made a visit to her lady-in-waiting, in order to discover secretly what the Princess would like. In this not uncommon way many things were proposed; the Chamberlain of his own idea added modern trifles, among them copies of colored initial letters, which just then were painted in

\* Translation copyrighted.

albums and letter-sheets, for he knew that the Princess had wished for things of the kind. The Sovereign glanced over the list, and at last stopped at the initial letters.

"These Parisian manufactures will hardly please the Princess. Could she not have painted letters copied from old parchments by a draughtsman? Did you not extol Magister Knips to me? He could prepare very pretty little designs."

The Chamberlain expressed deferent surprise at his Highness's idea, and sought the Magister. Knips promised to paint all the letters of the alphabet in the old characters, and the Chamberlain meanwhile looked after the cover. When the work of the Magister was laid before the Sovereign he was indeed surprised.

"These are like the beautiful old rubrics," he exclaimed; "how do they come here?"

Every letter was so painted on the old parchment that at cursory glance it could not be discovered whether the work was old or new.

"This shows wonderful talent; take care that the man is compensated according to the value of his service."

Knips lapsed into a state of respectful transport when the Chamberlain demonstrated to him the satisfaction of the Sovereign in shining coins. But it did not end there. For shortly afterwards the Sovereign visited the museum at the time when Knips was working. The Sovereign stopped again in front of the Magister, and said:

"I was delighted with your pictures. You possess a rare aptitude: both eyes and judgment might be deceived by the counterfeit of antiquity."

"Your most gracious Highness must pardon me if, on account of shortness of time, the imitation was imperfect," replied the bowing Knips.

"I am quite satisfied with it," rejoined the Sovereign, examining sharply the countenance and bearing of the little man. He began to vouchsafe a feeling of interest for the Magister. "You must have formerly had opportunities of exercising this art in a remunerative way."

"It has been reserved for your Highness to render my little dexterity valuable to me," replied Knips; "hitherto I have only practised such imitations for my own pleasure, or here and there to please others."

The Sovereign laughed, and went away with a gracious nod. Magister Knips was judged to be very useful.

\* \* \*

The Princess was sitting at her writing-table; the pen in her little hand flew over the paper; sometimes she looked into a book, which had a learned appearance, and copied passages which were designated by marks. Steps in the ante-room disturbed her work;

the Hereditary Prince entered, with an officer in foreign uniform.

"Sit down, children!" exclaimed the Princess. "Put aside your sabre, Victor, and come to me. You have become a handsome fellow: one can see that you have taken your place among strangers."

"I am breaking my way through," replied Victor, shrugging his shoulders, and laying his sabre cautiously near, that he might reach it with his hand.

"Be tranquil," said the Princess, consolingly; "we are now safe; he is busy."

"If he said so, we must not depend upon it," replied Victor. "You have become serious, Siddy. Even the room is changed—books, nothing but books." He opened one at the title-page. "'Archæology of Art.' Tell me, what are you doing with this trash?"

"I am breaking my way through," repeated Siddy, shrugging her shoulders.

"Siddy patronizes learning," explained the Hereditary Prince. "We now have literary tea-parties, she has pieces read and rôles assigned. Take care, you will have to join it."

"I only read villains' parts," replied Victor; "or, at the most valets' rôles."

"The inferior parts are always my share," said the Hereditary Prince. "The best that falls to my lot is a good-natured father, who ends by giving his blessing."

"He has talent for nothing but open-hearted goodness; he protests if he has more than four verses to recite, and even with that there are pauses during which he fidgets with his lorgnette."

"His proper vocation would be that of pastor," said Victor, mockingly. "He would favor his congregation with short sermons, and set them a virtuous example."

"If he were only better than you, there would be no merit in it, Victor. You have the reputation of playing such naughty tricks that we are not allowed even to know them?"

"All calumny!" cried Victor. "I am harshly judged in my regiment because of my strict principles."

"Then Heaven preserve us from an invasion of your comrades. I am glad that you mean to pass your leave of absence in our parts; but I am surprised at it. You are free: the whole world is open to you."

"Yes, free as a jackdaw that is thrown out of its nest," replied Victor; "but there are times when it occurs to one that a garrison has not all the charms of home."

"And that you seek with us?" asked the Princess. "Poor cousin! But meanwhile you have been campaigning. I congratulate you. We hear that you behaved gallantly."

"I had a good horse," said Victor, laughing.

"You have also visited all our relations?"

"I have penetrated the mysteries of three Courts," replied Victor. "First, at my cousin's, the innocent shepherd's Court,—a charming rural life! The Grand Marshal carries embroidery in his pocket, at which he works among the ladies. The lady-in-waiting comes with her spaniel to dinner, and has him fed in the kitchen. Twice every week people are invited from the city to tea and pastry. When the family are alone at their tea they play for hazel-nuts. I believe that they are gathered in the autumn by the whole Court. Then I went to the Court of my great-uncle, with the six-foot grenadiers. I was the smallest of the society. One day all were in the costume of generals, the day after all were Nimrods, in hunting-coats and gaiters. One day it was drilling, and the next hunting. Powder is the greatest article of consumption at Court there. Even the ballet-dancers, they say, wear uniforms under their gauze. Lastly, there was the great Court of Aunt Louisa. All with white heads and powder. Any one with the hair of youth endeavoured to rid of it as quickly as possible. In the evening virtuous family conversation, and if any talked scandal, they would on the following morning receive an order from the Princess to contribute to some benevolent institution. The Princess Minna asked me whether I attended church regularly, and when I told her that at all events I played regularly at whist with our chaplain, I was held in great contempt. She danced the first country dance with her brother and only the second with me. The evening society was accurately arranged according to the respective dignities of the guests. There was the hall of the Privy Councillors, of the Chamberlains, and of the small folk of the Court; and, besides that, a lower place for an unavoidable class of citizens, in which bankers and artists wait to be noticed by their Highnesses."

"These formalities make us ridiculous to the whole world," exclaimed the Hereditary Prince.

The Princess and Victor laughed at this sudden ebullition.

"Since when has Benno become a Red?" asked Victor.

"It is the first time I have heard him speak in this way," said the Princess.

"A prince should only invite gentlemen into his society; but whoever is there should be considered as the equal of the rest," continued the Hereditary Prince.

Again the others laughed.

"We thank you for the wise remark, Professor Bonbon," cried Siddy.

"It was in this room that we dressed you up as an owl, Bonbon; and you sat here groaning under Siddy's mantle when the Sovereign surprised us."

"And where you received punishment," replied

Benno, "because you had so disfigured a poor fellow like me."

"Fix him up again!" cried Siddy.

Victor took a colored silk handkerchief, formed two points by knots for ear-tufts, and covered the head of the Hereditary Prince, who quietly submitted. His serious face, with his dark eyebrows, looked strangely from under the covering.

"The feather-coat is wanting," exclaimed Siddy; "we must imagine it. I am the quail, and Victor the cock. I know the melody that we used to improvise as children."

She flew to the pianoforte and ran over the notes. The Hereditary Prince twisted the theatre-bill, which he pulled out of his pocket, into a cornet, and cried into it, "Tu-whit, tu-whoo, Mrs. quail, I eat you."

The quail sang: "Pik werwit old tu-wooh, that you will not do." And the cock crows, "Cock-a-doodle-doo, dearest quail, I love you."

"That has never been true, Victor," said the Princess, in the midst of the game.

"Who knows?" rejoined he; "cock-a-doodle-doo."

The concert was in full flow. Victor sprang about, clapped his hands and crowed; the Hereditary Prince on his chair screeched unweariedly like an owl; Siddy moved her head in time, sang her pik-wer-wit, calling out occasionally, "You are very funny little boys." A slight knocking was heard; they quickly left off their play; the sabre was restored to its belt; and the quail became in a moment the distinguished lady.

"His Grace your father begs to inform your Highness that he will wait upon you," announced the page.

"I knew that he would disturb us," cried Victor, in a rage.

"Away with you, children," cried Princess Sidonie. "I must repeat once more, cousin, that I rejoice to have you with us again. We three will hold together. Benno is brave, and my only comfort. Avoid conversing with me whenever the Sovereign is present. I will not take it amiss if you do not notice me at all. The spy who is placed about me is now my maid of honor, Lossau. Every word that you speak in her presence is reported; you know the gentlemen, they have not become more pleasant."

"There is Benno's Chamberlain," asked Victor; "the Sovereign was talking to him a long time to-day."

"He is good-humored, but weak," remarked the Hereditary Prince; "and devoted to his place. There is no dependence on him."

"Try to behave well, Victor," continued the Princess; "be a good Chinese, and wear your pigtail according to rule, and deport yourself exactly according to the privileges of the tuft that you wear on your cap. Now, away with you down the private staircase."

(To be continued.)

## NOTES.

It is a welcome sign of the times that liberal minds have ceased to be satisfied with mere negations. Mr. Courtlandt Palmer, we are told by his friend and co-believer, in the same manner as THE OPEN COURT, was not satisfied with agnosticism, but aspired and endeavored to formulate his religion as a positive and a universal faith. In thus doing, radical thinkers again draw near to the old conceptions of religion; they learn to understand and to appreciate them without falling back into their errors. The time is ripe. If our orthodox co-workers in the province of religious thought will but grasp the outstretched hand, we may come to a fair understanding. Mr. Palmer in his Nineteenth Century Club has set a fair model for the free exchange of ideas, without aspersion, reproach or obloquy. Let us follow his example and the seed that is thrown out in this way on both sides, will certainly bear much fruit.

We are in receipt of a manuscript by Mr. Gestefeld, who criticizes Mr. Hegeler's article, "Free Trade or Protection," on the ground that the American nation is in so far different from other nations as that here the people and the government are one, while in Europe they are not. The American people, he declares, is an organism, others must be compared to machines. Organisms and machines cannot harmoniously work together. The mechanism will crush the higher organic life that comes in contact with it. Therefore, Mr. Gestefeld concludes, in order to preserve the higher organic character of our people, we must build a wall of protection around us against the mere mechanical nations of Europe.

We have at hand a pamphlet entitled "The Formal Recognition of the Transfer of the Lick Observatory to the Board of Regents of the University of California": including a Letter from the President of the Lick Trustees, Captain Floyd; an Address in behalf of the Trust by E. B. Mastick, and a Responsive Address by Prof. Le Conte, in behalf of the Board of Regents. Pre-eminent among the sciences, as impressing the imagination and kindling the enthusiasm of man, Prof. Le Conte places Geology and Astronomy. This comparison forms the topic proper of the address—not unmarked by poetic beauty. The address by Prof. Le Conte is a masterly, though brief, review of the developmental history of scientific methods.

We have made arrangements whereby we will receive new subscriptions to the *Forum* with a subscription to THE OPEN COURT for \$5.00. The price of the *Forum* alone is \$5 a year. It is "the foremost American review" of living subjects, and among its contributors are 200 of the leading writers of the world. It gives authoritative discussions of each side alike of every leading question of the time. The *New York Herald* says of it. "It has done more to bring the thinking men of the country into connection with current literature than any other publication." This is an exceptional opportunity for every reader of THE OPEN COURT to secure the *Forum*.

An advanced copy of "The Nun of Kenmare," an Autobiography, by Mary Francis Clare Cusack, late Mother-General of the Order of the Sisters of Peace, published by Messrs. Ticknor & Co. of Boston, is in our hands. It is the complaint of a high-minded woman for having been prevented by prominent church authorities from carrying out her work of devotion and charity. Her faith in the Pope, as explained in a letter to him, seems unshaken. She believes that his Holiness has been misguided. This autobiography states the one side, and whether we shall ever hear the other side remains still an open question.

Rev. W. H. Thorne, of Philadelphia, the author of "Modern Idols," (formerly a minister of the Presbyterian Church), informs us that he has founded a congregation called Unity Church, in which he attempts to teach a Universal Religion.

Dr. W. T. Harris, Prof. Thomas Davidson, Prof. Calvin Thomas, Mrs. Caroline K. Sherman, and Mr. D. F. Snider completed their Symposium on Goethe on Monday, December 31st. It was a worthy celebration of the Christmas week, and the success of these lectures proves that the West is rapidly gaining in intellectual breadth.

Prof. Cope discusses in the latest number of *The American Naturalist* the "Artiodactyla," a class of which the best known species are the deer, the antelope, the giraffe, and the bovine genera with their kin. The illustrations of the hoofs, the teeth, and the skulls of these animals will greatly enhance the interest in Professor Cope's article.

Henry Dunning Macleod's essay on "The Modern Science of Economics," published by the Manchester Statistic Society, criticizes the definitions of wealth by I. B. Say, Adam Smith, Richardo, Karl Marx, and others; pointing out that the nature of wealth is exchangeability. His opinion of John Law is the more noteworthy because Lawism is practiced still.

The Editor of the *Magazine of American History* has published in the January number of that journal an interesting article on "Historic Homes and Landmarks." It is an account of the romantic scenes and stirring events which made the whole "West End" portion of the New York City historic ground.

The Holiday number of *Wide Awake* contains the following little rhyme by M. L. H.:

"If I were a bird," said a boy,  
And exceedingly wise looked he,  
"I'd always build my little nest  
In the top of a Christmas-tree."

"Imperial Germany," a Critical Study of Fact and Character, by Sidney Whitman, is announced by Messrs. Ticknor & Co., and promises to be a work of great interest.

The January number of *Lippincott's Magazine* contains a notable contribution entitled "The Capture and Execution of John Brown," by an eye-witness.

"Remember the Tale of the Pygmy Fleet," is the name of a sweet picture which serves as a frontispiece in the January of *St. Nicholas*.

Professor Davidson lectured last Sunday before the Society for Ethical Culture of Chicago on the "Present Status of Thought."

"Pagan Ireland" in the January number of *The Century* is the first article of a longer series of essays by Charles De Kay.

Mendelssohn's Letters have been published by Ticknor & Co.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the Nineteenth Century is faith in the ideal unities as possible to fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents.  
The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.  
Evolution and Religion. By John Fiske. Price, 5 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR & CO., Publishers.

175 Dearborn Street, Chicago.

## AGENTS! double their money selling our Brass Finished Corrugated Reflecting Safety Lamp.

Can be sold in every family. Gives more light than three ordinary lamps. Full sized Lamp sent by Express for thirty cents. We also have the best selling Coffee Pot in the United States. Send for illustrated circulars to

FORSHEE & MCMAKIN, Cincinnati, Ohio.

## THE IDEA OF GOD.

By PAUL CARUS, Ph.D.

PRICE, 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God as an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

### OPEN COURT PUBLISHING COMPANY,

169-175 LA SALLE STREET,

P. O. Drawer F, Chicago, Illinois.

## "THE MICROSCOPE,"

FOR 1889.

The leading exponent of Microscopy in the United States.

The representative of what is best, most instructive, and progressive in American Microscopy.

An enterprising and liberal purveyor of Microscopical News selected from the most reliable scientific journals of Europe and America.

A reliable teacher for the beginner, and a medium through which advanced workers publish to the world the results of their labors.

Among the contributors to this journal are:  
Prof. CHAS. E. BESSEY, University of Nebraska.

Prof. T. J. BURRILL, University of Illinois.  
Prof. M. D. EWELL, Northwestern University.  
Prof. J. WALTER FEWKES, Harvard University.

Prof. C. H. STOWELL, University of Michigan.  
Prof. S. H. GAGE, Cornell University.  
Prof. H. L. SMITH, Hobart College.

Dr. ALFRED C. STOKES.  
Prof. JOHN A. BRASHEAR.  
Prof. HENRY MILLS.

Prof. H. N. WHELPLEY.  
Dr. F. L. JAMES.  
E. H. GRIFFITH, Esq.  
C. M. VORCE, Esq.

And many other well-known writers on microscopy.

Each number is replete with information valuable to educated Americans who desire to acquire a scientific knowledge in its broadest sense.

E. O. DRAWER F. CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

WILLIAM J. POTTER.

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishism is means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

WHEELBARROW

"WHEELBARROW" speaks to the laboring men from the standpoint of a laborer, although he does not work with a shovel and a wheelbarrow now. In his first essay, published in one of the early numbers of *THE OPEN COURT*, he says: "I sign my name 'Wheelbarrow' because that is the implement of my handicraft or was when I was a strong man. I was by profession a 'railroad man;' my part in the railroad business was making the road-bed by the aid of a pick, a shovel and a wheelbarrow." We quote this passage because from our personal acquaintance with "Wheelbarrow" we understand that it is literally true.

"Wheelbarrow" treats the labor question in a manner peculiarly his own, with illustrations drawn from every-day experience and presenting a moral which may be seen at a glance. He advises the working men in a friendly, persuasive way, and criticises many of their methods of reform as harmful to themselves, tyrannical and unwise. These essays have been much admired, not only by the working men, but also by men eminent in American literature. In an editorial article on "Wheelbarrow," the *Boston Herald* said: "He possesses in a striking degree the rare ability of being able to treat of complicated matters in so lucid and simple a manner as to make them easy of comprehension to those who have never before given the subject much thought. Last year he published a series of tracts on the labor question which were widely read, but not half so widely as they deserved to be. Treating of his subject from a working-man's standpoint, he displayed an extraordinary wealth of apt but homely illustrations."

WHEELBARROW'S essays are contained in the following numbers of THE OPEN COURT:

PROF. E. D. COPE.

In Number 23 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the idealist to deny the existence of matter. The materialist behold ing the imperfection of the senses may pronounce them to be, one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

## NATURE AND ETERNAL YOUTH.

BY PROF. GEORG VON GIZYCKI.

Death appears to us as a calamity; but greater would that calamity be, if there were no death: for death is the condition of the "eternal youth" of the human race. And so, in our innermost soul, we may make peace with death, and recognize that this arrangement of the order of the world which brings about a constant rejuvenation of life, is proper.

"Do not despise death," says the Stoic Emperor, "but be well content with it, since this too is one of those things which nature wills. For such as it is to be young and to grow old, and to increase and to reach maturity, and to have teeth and beard and gray hairs, and to beget, and to be pregnant and to bring forth, and all the other natural operations which the seasons of thy life bring, such also is dissolution. This, then, is consistent with the character of a reflecting man, to be neither careless nor impatient nor contemptuous with respect to death, but to wait for it as one of the operations of nature. \* \* \* Everything harmonizes with me, which is harmonious to thee, O Universe. Nothing for me is too early, nor too late, which is in due time for thee. Everything is fruit to me which thy seasons bring, O Nature: from thee are all things, to thee all things return."\*

We come in good company when we die. The place where all our loved departed lie and all the best men of times past rest—our mother earth—cannot be bad.

Let us merge ourselves in the unending being of the All, of which we are an actual part, in actual union with the farthest worlds. We are not strangers here, we rest in our home. Let us live here, therefore, with our whole souls; and let us be thankful and rejoice, that our native land, despite many a gloomy dale, is so beautiful. In us, nature exults in her own being; in us, nature blooms into consciousness; and the soil that, unceasing, produces new blossoms, remains preserved forever. Let us abandon our self-seeking, our arrogance and presumption, and disclaim the unreal absolute separation between us and the rest of nature. Let us plunge with our mind into the unceasingly rising and falling swell of physical and spiritual development, let us expand our Self until it encompass the

whole world, and we shall then experience its everlastingness.

Close thine acquaintance with Nature! And learn to revere her as mother.  
Then in the end thou wilt sink peacefully into the earth.

Do not fear death! thou wilt ever remain in the home that has born thee,  
Nor from the ground e'er depart, which in its love thee enfolded.

We are not spirits, but living bodies. Yet in so far as we are matter and energy, we are eternal. Schopenhauer well says: "Because the powerful arm that three thousand years ago bent the bow of Ulysses no longer exists, no thoughtful and logical person will think that the power is totally annihilated that once so potently animated the same, nor upon further reflection will he therefore assume that the power that bends the bow to-day, came first into being with that arm. Much nearer lies the thought, that the power that formerly animated a life now spent, is the same that works in the life now flourishing." (We now know that all energy is preserved.) "This will not, of course, satisfy the claims that people are accustomed to make upon proofs of a future existence after death, nor will it afford the consolation that people expect from such proofs. Nevertheless, it is something; and people who fear death as an absolute annihilation, need not condemn the perfect certainty that the innermost principle of life will remain untouched by it." Our substance too is eternal. "What! 'people will say, 'the life of mere dust, of crude matter, shall be regarded as the continuance of our being?' Ah! but do you know this dust? Do you know what it is, and what it can accomplish? Study it before you despise it. This matter that now lies before you as dust and ashes, will dart into crystals when dissolved in water; will shine as metal, will emit glittering electric sparks, will give rise to a force through its galvanic tension, that, decomposing the strongest combinations, can reduce earth to metals; yes, of its own self, it will rise in the form of plants and animals, and from its hidden bosom will unfold that life, the loss of which in your shortsightedness so deeply concerns you. To continue to exist as such a substance, is that so absolutely nothing?"

In so far as we are of the body, not an atom of us will be lost.

Yet—a fact more important for us still—in so far as we are of the spirit, we also have an existence hereafter. We are not "like grass," we flourish not "as

\* M. Aurel, IX. and IV. 23.

a flower of the field; for the wind passeth over it and it is gone, and the place thereof shall know it no more." Though we do die, yet the results of our life do not disappear. A noble deed, a good word are often the seed of thousandfold blessings. And though it be not apparent, yet the influence of a true and noble man, in whatever circle of life he live, is none the less real. And so, let us act immortally, let us so act, that the consequences of our actions are lasting life and not death. There is not a life that does not exercise upon others a beneficial or injurious influence; the good is the life-giving. We have a life before us that, if we so will, can become a model of excellence and righteousness. Is this prospect, then, worthless in our eyes, even if the individual life has in fact a limit? And when we stand at this confine and look back upon an upright and virtuous life, shall we then say it was worthless? "I do not repent of having lived," said Cato, "for I have so lived that I do not think to have been born in vain." The consciousness of duty performed makes death easy, and we can say with Paul: "Death is swallowed up in victory. O Death where is thy sting? O Grave where is thy victory?" And if we are good, we shall have left in the good men behind us a pleasant memory; the remembrance in the hearts of loved ones is a monument also. In this spirit Jeremias Gotthelf has the grandchild say, after the death of the revered grand-parent: "'Grandfather said'—'What would grandfather say'—'What would he think of it'—Such will be the best sayings in our house so long as we live."

Art thou afraid of death? thou wishest for being immortal!  
Live as a part of the whole, when thou art gone it remains.

As often as we love, so often do we live; we live the life of humanity, if we love humanity. Let us sow, that humanity may reap, let us strive after power, that humanity may grow better and happier, let us anticipate with hopeful spirit humanity's glorious future: and then we shall conquer death. The life of humanity is immeasurably long—for us, almost an actual eternity,—and the possibility, too, of the perfection of man and his conditions is immeasurably great. In the real earthly future of the human race our imagination finds a far more fruitful province than Heaven affords the fancy of the old-style believers. "When the conversation turned upon eternal life and its pleasures," said Dr. Martin,\* "I often ponder to myself, I cannot understand at all, what we are going to pass away the time with." And the thought, too, can console us, that our earth is not the only living world—life flourishes, here or on other planets, into all eternity.

Love of man dispels the fear of death. Even though we do grow older and the natural bound of life ever approaches nearer, yet that continues to live

which we love. Our interest in life, therefore, cannot diminish: the welfare of humanity has become our personal destiny. The answer to the question, "What shall I do to be saved?" ever remains the same: Love humanity better than thyself. There is no truer saying than that of the Song of Songs, "Love is strong as Death."

Our last hour is an act of life; we can transact it worthily or unworthily; our love or selfishness, our bravery or cowardice will show itself then for the last time. The hour of death makes an ineffaceable impression upon those that survive us; whosoever, then, while conscious, sees it approach, will regard it as a matter of duty to ennoble the last act of life. He will, if he be among beloved friends, once more afford them a proof of his love, and this of itself will yield him consolation. Duty and Love—they are the conquerors of death.

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XLV.

#### HEALTH AND DISEASE. (Continued.)

The Chinese "*Book of Rewards*" tells a story of two lovers who became infatuated with the charms of the same maiden and who both were distracted by the death of their enchantress. But after her burial the elder of the rivals renounced the world forever and retired to a hermitage, while the younger continued his quest of happiness and finally won a fairer and better bride. The moral of the parable seems intended to inculcate the advantages of perseverance, but indirectly also illustrates the contrast of certain influences of health and disease. The victims of decrepitude endure the spite of fortune in stolid resignation, while conscious strength refuses to accept defeat and woos success by different methods, or in a new arena. Worn-out races seek refuge in resignation more easily than their healthier, though geographically perhaps less favored, neighbors; as emigrants, for instance, the effete natives of Portugal and southern France show less enterprise than the landlocked Hungarians and Swiss highlanders. The restless energy of our American competitors for the prizes of fortune has carried them further and further west, and the population of the Pacific slope thus represents the luckiest survivors of the moral marasmus that turned mediæval Europe into a lazaretto of madness and misery.

In many respects, therefore, that population should be distinguished by the moral characteristics of comparative health, and, indeed, exhibits many curious analogies to the moral types (if not the moral standards) of Pagan antiquity: The same boyish love of

\*Luther, Table-Talk.

\*Translation copyrighted.

mirth, the same frankness, the same hatred of despotism, of formalism and hypocrisy, the same generous impulsiveness, but also the same impatience of restraint, the same recklessness and fierceness of self-help. The virtues, as well as the vices of the typical Westerner, in fact, represent the extreme antithesis of the world-renouncing monastic type of early Christianity. The orthodox clergyman of a western mining-town still preaches the duty of passive submission to established authorities: his hearers defy those authorities at the slightest provocation. He repeats the commandment of meek non-resistance to evil: they pull their revolvers at a mere verbal discourtesy. He preaches the vanity of worldly wealth: they break their necks in a scramble for nuggets. He insists on the duty of humility: they prefer death to humiliation. He inculcates the efficiency of prayer: they woo the favor of heaven with crow-bars and blasting-powder. He describes the deadly snares of the arch-fiend and groans as he depicts the horrors of Gehenna: their comment, at the mere mention of that name, is expressed by a horse-laugh. He enlarges on the sinfulness of secular diversions: they would barter a stack of prayer-books for a fighting-cock and would shoot Sir Hudibras for interfering with a fandango. He assures them that weeping is better than laughter: they would dispense with sunshine as soon as with fun. He adjures them in the name of the moralist who commanded his disciples to abandon their families: they will travel a hundred miles afoot to rejoin their wives and youngsters. His gospel of other-worldliness has become a dead letter to men whose instincts rebel against the folly of sacrificing a safe present to an unknown future.

It is a significant sign of the times that in California, "the prototype of future America," sabbatarian despotism has never dared to rear its viper-head while the preponderance of secular over mythological influences is greater than in any other part of our national territory.

The "Land of the Setting Sun," like ancient Greece (blessed by an almost exactly similar combination of geographical and climatic advantages), is a land of realism and Nature-worship, and its prosperity offers an additional encouragement to the hope that on the whole the current of moral tendencies is rapidly returning from Ghostland to Earth. In the New World, at least, the doom of Anti-naturalism seems clearly sealed.

A less simple problem is involved in the question in how far such symptoms of returning health can be accepted as unpropitious to the prospects of *Spiritism*. Anti-naturalism is indisputably a symptom of disease, equally morbid in its cause and in its tendencies. The spiritualistic *diathesis*, as Carl Vogt expresses it, may,

however, imply an exceptional, rather than a morbid, or morbidic, state of physical concomitants. There are men who, in full possession of their usual health, have perfected their sense of touch to that degree of distinguishing objects which other persons can distinguish only by the tests of optical evidence, and even if that faculty should have been acquired at the expense of physical comfort (as by abrasions of the skin, in order to make the finger-tips, etc., more sensitive) that circumstance would not necessarily invalidate the competence of their conclusions. For similar reasons the phenomena of spiritualism can hardly be discredited by ascribing them to an *abnormally sensitive* condition of the psychic organism. In other words, the symptoms of special physical disorders may include the functions of a mental stimulant. The febrile effects of various stimulants are so well known to react on the brain, that habitual opium-eaters and dram-drinkers often come to consider a dose of their virulent drug an indispensable preliminary of mental efforts, and Lord Byron, as well as Carl Weber (the author of *Democritus*) record the fact that they used aperient medicines for a similar purpose. Laurence Sterne wrote the last chapters of his *Sentimental Journey* under the influence of an hectic fever. Memories of bygone events have often been almost miraculously revived by abnormal conditions of the body (insomnia, the fever of excessive fatigue, the incipient symptoms of strangulation, etc.), and the Yogis, or Brahminic enthusiasts, are said to induce visions of departed friends by starving themselves into fainting fits.

Psychology is too sadly far from having attained the standpoint of a positive science, to warrant the dogmatism of the materialists who absolutely deny the possibility of enlarging the scope of mental vision by physical artifices, and who think it inconceivable that bodily infirmities could intensify, or, indeed, fail to impair, the vigor of the mind.

We must beware, however, of falling into the mistake of confounding the effect with the cause of intellectual energy, in trying to explain the frequent concomitance of genius and disease.

"The fiery spirit, working out its way,"

may undermine the stamina even of vigorous constitutions, and Arthur Schopenhauer goes so far as to consider certain mental gifts absolutely antagonistic to the physical interests of their possessor. "The human brain," he says, "is a parasite which attains an abnormal development only at the expense of other vital organs, and transcendent genius generally precludes the hope of long life, or else avenges its prerogatives in the abasement of the next generation. Nay, even the *lex parsimoniae*, Nature's thrifty habits, preclude the hope of a simultaneous excessive development of mental and physical vigor. Young apes, in

their years of immaturity and helplessness, often amaze the observer by their almost human intelligence and docility; in after years that disposition gives way to stupid truculence, as if Nature had deemed it superfluous to lavish intellectual faculties on a creature abundantly able to make its way through life by dint of physical strength."

Perfect mental and perfect physical health are perhaps necessary concomitants; but the evidence of biographical records leave no doubt that abnormal (and especially one-sided) mental pre-eminence, is compatible with all sorts of physical infirmities—occasionally even with cerebral disorders. Cromwell and Dr. Johnson often passed weeks in a state of mental despondency bordering on despair. In the case of Swift, Tasso, and Cowper, that disposition became chronic. Rousseau's eccentricities justified the suspicion of madness. Lord Byron's best friends pronounced him unfit for the duties of domestic life. Saint Simon was subject to fits of hypochondria, which at last drove him to suicide. Fourier, Swedenborg, Luther, and Dr. Zimmerman were troubled with bewildering visions. Julius Cæsar was subject to epileptic fits. Newton, Pascal, Auguste Comte, Albertus Magnus, and Cardan had periods of mental aberration that terrified their friends with doubts of their mental sanity. Richelieu suffered from hallucinations as strange as that of Nebuchadnezzar; "he would fancy himself a horse and prance round the billiard-table neighing, kicking out at his servants, and making a great noise, until, exhausted by fatigue, he suffered himself to be put to bed and well covered up. On awakening, he remembered nothing that had passed." Peter the Great was eccentric to a degree that would have doomed any other man to the insane asylum. Charles XII, of Sweden, Felix Sylla, Mohammed the Second, Haroun Al Raschid, Alexander the Great, and Sultan Bajazet were subject to fits of uncontrollable rage. So were Dr. Francia and the poet Landor. Mozart died of water on the brain; Beethoven was morbidly sensitive and eccentric; Molière was liable to cataleptic fits; Chateaubriand to attacks of the darkest melancholy; George Sand to suicidal temptations. Chatterton, Gilbert, and probably Rousseau yielded to that temptation. Alfred de Musset and Poe died a drunkard's death, and Donizetti ended his days in a mad-house.

Yet all those examples seemed to confirm Schopenhauer's theory rather than the hypothesis of Dr. Moreau, who held that genius is merely an incidental symptom of nervous disorders—"a mere allotropic form of that abnormal condition of the nervous centres which elsewhere manifests itself as epilepsy, monomania, or idiocy—the physiological history of idiots being, in a multitude of particulars, the same as that

the majority of men of genius, and *vice versa*." That strange assertion would be sufficiently refuted by the frequent concomitants of nervous disorders and the most commonplace intellectual mediocrity, but also by the still more frequent contrast in the hereditary antecedents of idiocy and genius. Imbecility can nearly always be traced to an ancestral taint of mental unsoundness or vice, while genius springs as often from a lineage of health and physical vigor. Queen Christina's and Marshal Saxe's fathers were stalwart kings. Goethe's and Schiller's, robust burghers of conservative habits. So were Napoleon's, Mozart's, Heine's, Schopenhauer's, Franklin's, Galileo's, Haller's, Herschel's, Newton's, James Watt's, Milton's, Beranger's, Beethoven's; and Vandyck's, Bunsen's, Burns's and Carlyle's parents were honest peasants. Lessing's and Addison's were simple country parsons. Schopenhauer's view is still further supported by the genealogical infecundity of genius. Not one of a hundred great statesmen, poets, or philosophers, has transmitted his talents to his offspring.

As a rule, then, we may assume that disease is *far oftener the effect than the cause* of abnormal physical vigor, so much so, indeed, that under ordinary circumstances it tends to impair, rather than to promote, the development of inherited talents.

Nor can there be any doubt of the anti-moral tendency of many physical disorders. Principles of honor, of veracity, benevolence, justice, chastity, may all yield to the influence of lingering disease. Certain nervous disorders beget an almost uncontrollable desire for the perpetration of mischief. Only a few months ago a young girl made three different attempts to burn the buildings of a New York charity hospital, where, on account of her youth (less than twelve years) and her bodily infirmities, she had been treated with invariable kindness. On being confronted with the undeniable proofs of her crime, she burst into tears, and, with passionate emphasis, reiterated the plea that she "could not help it, though she had almost gone crazy in trying to fight it down," and added, that she had more than once been on the point of asking the superintendent to send her away, and that she would have run away if she had not felt sure that her evil penchant would ripen into action somewhere or other.

Dr. W. B. Carpenter mentions the case of a young lady who had enjoyed all the advantages of a liberal education, and who, as a consequence of a nervous disorder, was seized with an irresistible desire to practice all sorts of deceptions upon her unsuspecting attendants, and at last tried to mystify her physician by sticking a handful of pins into different parts of her body and pretending that they had been swallowed in a fit of mental aberration and worked their way out,

after causing her untold agonies of internal pain. The circumstance that the migratory implements of torture had all come out head-foremost, at once suggested the real mode of their introduction, but nothing short of an hypothesis of moral insanity could explain the motive of the fair prevaricator, who could not possibly have been actuated by the desire of simulating disease for the reasons which occasionally induce soldiers and prisoners to enjoy a few weeks of rest in the hospital.

Mohammed the Second, the most accomplished monarch of his age, was subject to periods of chronic indigestion, attended by moral symptoms which often endangered the lives of his best friends. In one of those paroxysms he made a savage attack on a messenger who happened to approach him without the formality of a special permission, and once actually butchered his favorite page, Constantin Chranza, whom he had carefully educated for the special purpose of conciliating the good-will of his Byzantine subjects. A perhaps still stranger case is that of the young Scotch pedagogue, Thomas Hunter, who was hanged at Edinburgh, August 22, 1700, after having his right hand struck off at the foot of the gibbet. Hunter had been engaged as a tutor to the sons of Col. Gordon, the chief bailie of Edinburgh, and a year after (having been guilty of some indiscretion which his pupils reported to their father) was kept awake several nights by the fear of losing his position. That fear proved to have been unfounded, and Hunter continued to enjoy the confidence of his patron, but a week of insomnia had unsettled his mind, and the first time he got a chance to accompany his pupils on a butterfly-hunt, he lured them into a thicket and after savagely upbraiding them for their indiscreet gossip he assailed the eldest with a knife, cut his throat from ear to ear, and then overtook the murdered boy's brother and succeeded in taking his life just before his shrieks attracted the attention of a party of gentlemen who at the time were taking a walk in the fields.

The absence of anything like an adequate provocation was equally remarkable in the more recent case of Prof. Fütterer, a teacher at the Gymnasium, or classic high-school, of Heiligenstadt, Prussia. His versatile accomplishments made him a favorite both with his colleagues and pupils, till in the summer of 1859, he became subject to chronic headaches and fits of ferocity, which on more than one occasion justified the suspicion that he had actually attempted the murder of scholars who had provoked him by nothing worse than a chronological error or the mis-conjugation of some irregular Greek verb. The passionate contrition of the eccentric teacher complicated the mystery of the moral phenomenon, and after a protracted investigation he had just been re-instated,

when he proved the sincerity of his regret, or his determination to avoid a relapse, by committing suicide.

(To be continued.)

## FACTS AND PROBLEMS OF SCIENCE.\*

### THE CONDITIONS OF LIFE.

BY W. PREYER.

PART IV.

(Concluded.)

The fact that by the removal of all the external conditions of existence animal and plant life may wholly cease and, after the restoration of those conditions, may begin anew, must be regarded as fully established. For, in the examples given in the last chapter, as also in numerous other cases, every possibility of dormant life or of a *vita minima*, was excluded. Whatever may be said of dried infusoria, which have been kept in a vacuum and exposed without detriment to water at boiling heat—organisms which, it may be shown, hold undigested food in their transparent stomachs—no intelligent person will affirm that a transfer of material takes place in frogs and fishes that are frozen through and through.

It is a striking proof of how very difficult it is for the human mind to accept such truths as destroy opinions and articles of faith early rooted in the affections, that even prominent scientists like Alexander von Humboldt, Ehrenberg, and others have held fast to the "*Eternal Whirl*" of matter in living beings. And even to-day very many would explain all the observations and experiments which I have adduced, as mere illusions. But since the same sort of experiments may be easily instituted, doubts will vanish by and by and the old views respecting life will be abandoned forever.

According to these views there belong to the fundamental conditions of life a *life-substance* and a *life-force*.

To assume, in addition to the known elements, a simple substance which by its presence in all living organisms alone conditions their vital phenomena, is inadmissible for the simple reason that the chemical elements constituting these organisms (the elements were given in Part II of this essay) are such indecomposable substances as of themselves exhibit phenomena of life when united together in certain unions and arrangements under known conditions. Thus, the former hypothetical element or fundamental substance of life would not be distinguishable from these latter elements, each one of which conditions the phenomena of life; for, if it existed, it would after all be effective only under the same conditions, and not during the completely parched or frozen state.

The times have happily gone by, when prizes were

\* Parts I, II, and III of the above article appeared in Nos. 34, 35, and 36.

offered for the solution of the question as to whether plants produce an element, like nitrogen for instance.

Still even now, though in a somewhat different sense, it is an open question with some whether one of the organic elements may not be produced from the others. Here carbon would come into consideration. In all its different elementary forms telluric carbon either bears in itself the unmistakable stamp of organic structure or it may be traced back with certainty or probability to extinct organisms. And this is the case with no one of the other elements. Even graphite, in which the characteristic stamp is almost obliterated, is probably a changed form of plant carbon. We can produce it from coal and diamonds which in their turn are of vegetable origin. If, therefore, there is now no inorganic carbon, and carbon is an element, compounds of carbon must have been formed before the origin of plants on the earth; and in the structure of these compounds carbon must have existed in a form in which it now no longer appears. The carbon of carbonic acid gas is cited in claim of this. The carbonic acid gas which volcanoes send forth may arise, however, from the decomposition of carbonic acid salts of organic origin, or possibly from combustion of plant carbon; and if there are some carbonic acid salts which cannot be traced to animals and plants—there is even fluid carbonic acid gas in quartz in microscopical pores—it is still a badly founded hypothesis to assume that there were formerly enormous amounts of carbonic acid gas by means of which the first organisms were formed. This assumption is commonly made in order to explain the first origin of life; and there seems to have been no fear on the part of scientists of a false conclusion. Even to this day there has been discovered no sufficient source of carbon before the appearance of plants upon the earth. Only the small amounts of cosmic carbon from meteorites can be adduced beyond question. And even in respect to these it is not easy to prove that they did not spring from living bodies of other worlds.

Accordingly, if carbon, which exists in abundance in all living things, is in the chemical sense an element, incapable of analysis and unchangeable, and therefore not derived, nor transitory, then if it is not exclusively of organic origin, it is incomprehensible how it could have passed through organisms almost without the loss of so much as a remnant. I merely intend to call attention here to a difficulty which is greater than has hitherto been supposed and which strongly impels us to doubt the elementary nature of carbon. So long as this question is not settled little can be said of the "how" of the first appearance of vegetable and animal life on the earth.

Not less precise than its position as to the life-substance is the ground which the present investiga-

tion of life takes against the former assumption of a special life-force. The latter theory which holds that the supposed "whirl of matter" must take place as long as the life of a body lasts, has been set aside forever by the re-animation of animals, plants, eggs and seeds of the most different sorts or classes after they have been dried up, frozen and kept without air and food. If it is possible, though only in a single case, utterly to destroy life merely by the withdrawal of water or heat, and to restore it again after any length of time by the restoration of water or heat, there is no longer a corner into which the theory of a special life-force can seek shelter. Just as if somebody by drying up a cistern should wholly destroy a spring, and by restoring the water set it running again, and then gravely assume a special spring-force. Or, just as if somebody by cooling off a piece of glowing iron so that it no longer glowed, and by re-heating it should set it glowing again, and then assume a special glowing-force!

From the fact that the life-process may be interrupted at pleasure and restored again to normal action, like the spouting of fountain or the white heat of metal, a very important result is attained which heretofore has not been brought forward. I mean the necessity of sharply distinguishing between the two opposites of *living*—the contradictory (the *logice oppositum*) *not living or lifeless*, and the contrary (the *realiter oppositum*) *dead*.

All organisms are either living or lifeless. Those not living, hence inanimate or lifeless, are, however, in no wise always dead. Rather, they are either *lifeless*, but *capable of life*—*anabiotic*, i. e., capable of reanimation, apparently dead in a narrow sense—or they are *lifeless and incapable of life*, for which state the term *dead* is used. At the present time, however, the distinction between the two last named conditions can not be definitely given. It is only to be regarded as very probable that death consists in an important, irreparable change in the structure of the tissues. But since such a change has not been proved in all cases of death and perhaps never can be proved in all, and since in every unsuccessful attempt at reanimation where such structural changes are not demonstrable the absence of vital activity may be traced as well to the shortcomings of the experiment as to the lack of vitality, the question as to the distinction between *capable of life* and *incapable of life* will always remain of a transcendental character.

Or we may go still further. It may be highly probable that by careful observation we could distinguish with certainty in each individual case the living from the lifeless; but still it would be difficult to affirm with assurance in each individual instance whether a lifeless organism is capable of life or not, whether

it is anabiotic or dead; since only one experiment with re-animation can decide the matter, and since the absence of vitality does not necessarily follow from the *failure* of this one experiment in the same manner that the presence of vitality would be inferable from its *success*.

Effective as is the comparison of an organism with a machine, it is here inapplicable. We can indeed compare an engine which moves and works when it is carefully supplied with air, water and food (i. e., coal and oil) and is heated, to an active organism which is likewise carefully supplied with air, water and food and heated, in so far as both cease to operate without becoming incapable of work if these four conditions are wanting. Further, a motionless, heated machine may be compared without violence to a living organism at rest or asleep, and a broken machine, incapable of work, to a dead organism, incapable of life. For a machine cannot work uninterruptedly any more than an organism can; it too requires the alternation of rest and activity if it is not speedily to suffer injury from overheating and disuse, and to become ill, so to speak. But in a machine it is not difficult to find whereby it is incapable of work, be it rust, be it lack of proper adjustment, or be it worn out in its parts; while in the organism it is often impossible to find the cause of death, and even when it is found no one is able to remedy the evil as in the case of the machine.

This great distinction, however, is not a difference of the mechanical principle involved; it is to be attributed solely to the incomplete means of investigation and the defective therapeutics at our command, the former of which can never with certainty perceive the defects in the body, and the latter can never remove insufficient heart-beats and weak lungs and supplace them with sound organs.

There are other phenomena of life besides death, the last of all, which fail to support the comparison of organisms with machines. Right where the mystery of life is the darkest, the torch of the mechanical attempts at an explanation goes out. *Growth* and *generation*—the latter a special sort of growth, extending beyond the individual person—may perhaps be explained in the future, just like digestion and respiration, as machine-work; but perceiving, willing, and imagining cannot be comprehended as mechanical processes. For this class of phenomena from the founding of mechanics to the present day, no sufficient explanation has been offered. In both fields of inquiry the methods are still lacking for the investigation of the unascertained data. And the mass of wholly certain facts is in no wise so great that the hypotheses based upon these facts must be confirmed by them. The organic conditions are still too little known. An experimental doctrine of evolution, an experimental comparative

physiology are only young sciences. An experimental psychology has been founded only in the most recent time. A comparative psychology scarcely exists as yet. These studies, however, must be thoroughly established before we can attempt an explanation of vital phenomena. Respect for facts is the corner-stone of every good theory.

But though so many facts from the fields of psychical phenomena have been determined with certainty, they are so little receptive of a mechanical explanation—judging at least by those already known—that it might very well be questioned whether those processes can be investigated with the means hitherto employed.

Undeniable as is the title and worth of the present mechanical explanation of life, strong as is the support which it receives from the artificial removal and the life-giving restoration of the conditions of life, still it affords no prospect of explaining by mechanics alone the complicated spiritual manifestations of life, even though it may know ever so accurately the conditions of physical life. Only he who is inseparably chained to the principles of modern mechanics and is carried away with its unrivalled successes, can deny that by itself alone it is incapable of explaining satisfactorily the will or the perceptive faculties; only such a one can submit to those incomprehensibilities, "force and matter," or on the other hand assert, because mechanics cannot explain spirit, that it is unexplainable. It is indeed much easier and much more convenient to explain as many things as possible mechanically than to discover laws which will be effective, independent of all mechanics.

Modern mechanical science proclaims as dogma altogether too much of that which is not yet understood. And if it does appease or satisfy curiosity better than all other methods, it is still to be questioned whether with its present current principles it will be effective in the future, since the satisfaction it affords is one-sided. It fails to explain too many objections to deserve the measureless deification it now enjoys. It is warranted, it is necessary, but it is overestimated. At all events it is to be hoped that in the construction of a science of mechanical physiology the light of philosophy may not be shut out.

Just at the present time the advocates of this victorious view should be careful to keep within bounds. But after natural science has acquired its sovereign independence it has still a double duty—firstly, not to erect purely one-sided limits and, secondly, not to combat dogmatism dogmatically, but to give instructions in which on the contrary tolerance and reserve are characteristic features. Other coins have value besides those which science stamps; and other things have weight besides those which science weighs.

So long as we regard this matter in a different light, so long as we do not recognize in philosophy a science of principles like mathematics, progress though it may be rapid, will not be sure enough. We must know whether the basis on which we operate is weak or strong as we draw near the goal.

This end which the empirical investigation of life hopes to attain is the determination of all the conditions of life. Not the final cause, not the necessity, not the purpose of life, is its end and aim.

And if at times the translucent crystals of true discovery shoot in amid the turbid mass of errors, if a scientist deciphers correctly a passage of the book of truth—that book so infinitely difficult to read—even then he has not made the costly treasure though he may have spent both toil and pains in bringing it to light; he but speaks with stammering tongue what gracious nature in a happy hour has granted to him.

#### A GENERATION WITHOUT PROSPECTS.

BY MORRISON I. SWIFT.

The question what shall be done with boys to give them a fair start in life is obtaining a new significance now that so many of the old avenues of activity are being closed\* and when the temptation is strong to spend boyhood years in occupations that bring an immediate income but which train for nothing and lead no higher. While the problem is grave enough for the youths themselves and for those whom they try to help with their earnings, it is a still more serious affair for the general community. When the time of life at which any income seems acceptable and large is past, there comes discontent if other natural wants cannot be satisfied. The proper time for marriage arrives and as yet these young men are not well qualified to even to support themselves. They refrain from marriage and follow vice, or they hopefully leap into the gloom and surround themselves with a family whose sustenance is precarious, whose education is impossible, whose health—such as was ever possessed under these conditions—is undermined, and whose next descendants will recruit the prostitutes, criminals, and insane, or be youthful victims of death if fortune is moderately generous to them.

For this neglect of its youth the whole community pays a heavy penalty. An epidemic infects the social atmosphere causing immeasurable pain and observing no limits as to whom it afflicts. Nevertheless, the forefathers of this physical degeneration and moral depravity were industrious and faithful boys, taking up the cares and burdens of life too soon, but with a manly purpose. They were of stuff from which vigorous and useful progeny should have sprung.

But they were neglected, and an idea is prevalent

\* See article by Noah Brooks in the *Epoch*.

in our fresh new country that is responsible for much of this neglect. Our successful men of trade and industry began poor and subdued fortune, and this to them is forevermore the law of human success. In their eyes the world stands still and the conditions of victory in trade are invariable and eternal. In their youth no barriers were insurmountable and in their firm opinion no barriers are insurmountable still. Nor do they imagine that men differ in capacity, but, because they conquered, all men should conquer and those who do not, stand condemned. And now, as if Providence had set his face against us and determined upon our destruction, it happens that these men hold great influence and their opinions are much deferred to. 'Tis still the fancy of innumerable parents who might order it otherwise, that their children should be thrown upon the world without much training at an early age, to shift and learn for themselves. We cannot wonder, then, that those who must early struggle for daily bread are not much helped or trained out of the general purse. Our over-ripe watchword still is: "Let the boys alone; it will bring out their best qualities to bear hardships. We had them, and do but observe the results."

In all sincerity and good intention this is being continually said, and the boys of our altered generation are left to their unequal contest. It is humiliating to be compelled to repeat, in this day of obvious revolution, that times have changed. But times have changed, and it is no longer wise or safe to toss boys at random into the crammed and merciless business world, and tell them to go to work and succeed. It requires no little bravery to say what must be said as commentary upon this heroic process, but truth must out, and it is certain that an amazing number of the men who now own the world, could not to-day start penniless boys, as they once did, and achieve such mighty distinction. Instead of the golden glory that surrounds them, in place of being taken for superior men by all whom they meet, they would end as clerks or green-grocers, and their greatness would be undiscovered even by themselves.

Painful as these facts are, we must accustom our minds to them, and modify our actions accordingly. If these giants of our day could not cope empty-handed with the fearful odds that our day opposes to every new aspirant, how can the average and undisciplined many be expected to win laurels, even if the wealth that crowns them be nothing more than food and shelter and raiment for themselves and the little ones?

To this our self-made men have their reply. They insist, perhaps not unreasonably, that the business world itself is the best business school, and they ask, what better can we do, even to-day, though the imped-

ment be infinitely greater than formerly, than to throw the boys into the midst of the struggle and let living circumstances and actual trial teach and develop them? Precisely here the real difficulty confronts us. The positions that are open to the rank and file of boys and young men are not such as give them progression and preparatory experiences. After five years they are no better fitted for an occupation commensurate with the developed powers of a man than after one.

Want of preparation or the possibility of it: this, then, is to-day a source of unlimited evil.

There is still, of course, such a thing as natural growth in business, but it lies within the reach of only a few and therefore furnishes no solution of the problem. Occasional instances like the following prove this. Some years ago the son of a wealthy iron-founder, having finished his studies at the city schools was given his choice of two courses. "You may go to college and take a profession if you desire it," his father said, "or you can enter business with me. But if you do the latter, it must be as I began. You must start at the bottom and serve a full apprenticeship at every step. Your wages will be those of the men at your side." The boy chose the latter course, and began by shoveling sand in the moulders' room. His father allowed no leaps, or neglect, or haste. "And now," concluded the gentleman from whom I have these facts, "that young man is one of the very best business men in his city, and every one acknowledges it. He is still under thirty, but there are few of any age who rank with him."

This was a case of progressive education. But then it was, as we all recognize, the extreme exception. The youth's father owned the industry. It would be rash to say that men were not left behind at each stage of the business who would have become equally skilled with the same advantages of promotion and responsibility. What we deplore is not that some enjoy this privilege but that the overwhelming majority have no semblance of it; and this way of letting almost everybody "chance it" with nearly a dead certainty of failure, is just what must be abandoned at whatever expenditure of money and effort.

Wealthy people are averse to squandering money and sympathy upon those who, as they say, waste the one and are impervious to the other. "We would gladly see the world better," some of them aver with an air of patronage for the person who supposes that it ever will be any better, "but what boots our effort? If we pay higher wages it is so much the more for drink. If the men who work for wages or a salary were fairly saying they might soon have a bank account, own their own homes, in fact be independent capitalists. But the trouble is they nearly all lack prudence and forethought."

We must beg the estimable persons who offer this ancient criticism, partially true and mostly false, to see that at least it cannot apply to that immense body of young men and women, the existence of which is admitted, who have no prospects of advancement and whose income is below the border line of respectable living, to say nothing of accumulation. Let us hold them—these persons of wealth who reiterate that their intentions are above reproach, that they would help their fellow-men generously if they knew a way—to their own declarations by showing them a way in which they run no risk of scattering their skilfully conjured thousands to the thankless winds.

We do not intend to discuss the disputed question whether society owes a man a living, but we accept without debate, and found our remedy upon it, the principle that society owes to boys and girls such an education as will enable them to gain for themselves a living, and one that is comfortable and attractive. We will briefly sketch the principles of such an education.

The most general and important principle, and the one as yet almost wholly neglected in schemes of education, is that the opportunity for training must be combined with the opportunity to earn a livelihood. Under any other proposition most of those whom we wish to reach could obtain no benefit. We take it for granted that manual training is to become a fixed element of public-school instruction. Suppose, with this as a groundwork, courses were arranged in the schools, so as to enable a child to be present only one-half of the time without loss of connection in his studies. If the course were continuous from morning to morning, and the same course were repeated in the afternoon, two sets of children could be provided for. Suppose, at the same time, that employers of children consented to engage two children half a day, each where they now have one for the whole day: the children would obtain both education and income. The employer would be benefited by having both fresher and more intelligent workers. The second principle, then, is that the public schools must develop an organic connection with the industrial world. The objection will quickly occur that the children's wages would thereby be reduced one-half, which they could not stand. If the absurd separation that we have made of education and the application of it, is overcome, the objection so far as it is real, will disappear. This will require a system of technical schools connected with the shops where the actual industry of the world is going forward, and that the most favorable avenue to these be the public schools. Here it shall be possible for the boy to pay his way, and very soon to do more than pay his way, while acquiring invaluable theoretical instruction. Our national industry calls for this higher training,

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXIX.—Continued.

Princess Sidonie hastened to the door of the reception-room to meet the Sovereign. The Sovereign passed through the rooms to her study. He cast a glance at the open book:

"Who has made these marks?"

"Mr. Werner noted the most important passages for me," replied the Princess.

"I am glad that you make use of this opportunity to obtain instruction from so distinguished a man. Apart from the pedantic manner which attaches to his profession, he is a remarkable man. I wish, on account of his disinterested activity, to make his position as agreeable as possible, and I beg that you will do your best towards accomplishing it."

The Princess bowed silently, closing her hand convulsively.

"As it is impossible to bring him and his wife into closer relations with the Court, I wish you would invite them to one of your little tea-parties."

"You must pardon me, my most worthy father, if I do not see how this can be. My evening parties have hitherto consisted only of my ladies and the principal members of the Court."

"Then you must alter that," said the Sovereign, coldly; "you are not prevented from introducing into it one or other of our officials, with their wives."

"Pardon me, my father; as this has never yet happened, every one would remark that the change has only been occasioned through the strangers. It would occasion much ill-natured remark if an accidental visit were to upset what has been the acknowledged rule up to the present day."

"The consideration of foolish gossip shall not prevent you," replied the Sovereign, angrily.

"My gracious father must take a favorable view of the considerations which hinder my doing anything of the kind. It would not become me, a woman, to dispense with the habits and customs which my lord and father has considered binding upon himself. You have deigned to permit the attendance of Mr. Werner at your small dinners, and I could, without giving any uncommon offence, receive him at my tea-table. His wife, on the other hand, has never been brought into relations with the Court through your own sanction. It would ill become the daughter to venture what the father himself has not done."

"This reason is a poor disguise for ill-nature," replied the Sovereign. "Nothing hinders you from leaving out the whole Court."

"I can have no evening society, however small, without inviting the ladies of the Court," replied the

to say nothing of its value to the operatives and employers individually. "It is stated by those who have especially attended to preliminary instruction in engineering, that three years at colleges of this kind (technical colleges), combined with two years in the work-shops, turn out better men than five years apprenticeship in the latter."\* With this system it will be possible and safe to provide a sum from which to advance money to such boys as are in absolute need of more than they can make at the beginning of their course. They can be allowed to mortgage their future labor, and, since their prospects are better in connection with the school than anywhere else, the security may be deemed sufficient. This, in the main, disposes of the objection that was raised regarding the diminished income of those who attend school a part of the time. It will be well if the principle of progression is carried beyond the period of youth. No one will say that proficiency is properly rewarded to-day;† worse than this, it usually goes wholly unrecognized and unencouraged. This cannot turn out good workmen or good men, nor stimulate the young.

The cry of many, and particularly of the wealthy, is, "Do not increase the functions of the state." There is an alternative to this course, against which no one has any objections to offer. If individuals, those who have the means at their disposal, will apply the individual initiation they are so fond of talking about, to reform and improvement, the state will not be called upon. Otherwise—

## AMBITION.

BY LOUIS BELROSE, JR.

How long ago it is since hope was mine:

How long ago since first it seemed to me

As if, at most, a few short years would see

The full accomplishment of my design.

Alas, 'twas ere that loveliest of the nine

Fair fickle daughters of Mnemosyne

Had made a mock of my simplicity,

And cast me off, and left me to repine.

In those old times I dreamt my song must sway

The nations:—now, my life would not seem vain

If later (shaving, as I was to-day)

Some lathered lover of old rhyme should deign

To read my torn leaf twice ere cast away,

And with his razor dull forget the pain.

\* Sir Lyon Playfair, M. P., *Nineteenth Century*, Sept. 1888.

† As we have often had occasion to point out, the greater efficiency of the workmen of this country is not compensated. This is not extraordinary, perhaps, for the rule of progress seems to be that efficiency increases in a very much greater ratio than wages. . . . There is no reason why his (the workman's) share of the product should decrease as his efficiency increases."—*New York Times*, Editorial; Oct. 15, 1888.

\* Translation copyrighted.

Princess, pertinaciously; "and I cannot ask them to take part in a mixed society."

"I will take care that Miss von Lossau shall appear," replied the Sovereign, in a bitter tone. "I insist upon your conforming to my wishes."

"Forgive me, gracious father," replied the Princess, in great excitement, "if I do not obey you in this case."

"Do you dare to defy me?" cried the Sovereign, with a sudden outbreak of anger, approaching the Princess.

The Princess turned pale, and stepped behind a chair as if for protection.

"I am the only lady of our house," she exclaimed; "and I have in this high position to pay regard to considerations from which, neither as the lord of this Court, nor as my own father, you can release me. If your Highness chooses to make new Court regulations, I will willingly conform to them; but what your Highness requires of me now is not a new regulation, but an irregularity which is humiliating for me and for us all."

"Impertinent, insolent fool!" cried the Sovereign, no longer master of himself. "Do you think you have outgrown my control because I once let you out of my hands? I have brought you here in order to hold you fast. You are in my power; no slave is more so. Within these walls no power prevails but mine, and if you do not bend to it, I will break your stubborn spirit."

He approached her threateningly. The Princess drew back to the wall of her room.

"I know I am your prisoner," she cried out, with flashing eyes. "I knew when I returned here that I was entering my prison. I knew that no cry of anguish could penetrate these walls, and that a slave would find more protection among men than the child of a prince from her father. But in this room I have a supporter, to whom I often look imploringly; and if your Highness deprives me of the help of all the living, I call upon the dead for protection against you."

She pulled the cord of a curtain, and the life-sized picture of a lady became visible, in whose soft countenance there was a touching expression of sorrow. The Princess pointed to the picture and looked fixedly at the Sovereign.

"Will your Highness venture to insult your daughter before the eyes of her mother?"

The Sovereign drew back, and gave vent to a hoarse murmur, turned away, and motioned with his hand.

"Cover the picture," he said, in a feeble voice. "Do not excite yourself and me unnecessarily," he began, in a changed tone. "If you do not choose to fulfill my wishes, I will not insist upon it." He took his hat from the table, and continued, in a softer tone: "You are beloved by the citizens; the weather is as warm as summer, and promises to last. I will, on your birthday, arrange to have a morning concert for the officials and the citizens in the park. I will send

you a list of invitations through the Lord High Steward. In the evening we shall have a gala-supper and visit the opera."

The Sovereign left the room without looking at his daughter. The Princess followed him to the ante-room, where the attendants were standing. At the door she made a low curtsy. The Sovereign gave a friendly sign with his hand. The Princess then flew back into her room, threw herself down before the picture, and wrung her hands.

\* \* \*

The Princes were walking in the park, and the promenaders bowed and looked after them. The Hereditary Prince took off his hat with the dignity of a man; Victor touched his hussar cap lightly, and nodded sometimes familiarly to a pretty face.

"All old acquaintances," he began; "it is a pleasure, indeed, to be home again."

"You always were a favorite of the people," said the Hereditary Prince.

"I have amused and provoked them," replied Victor laughing. "I feel like Hercules with his mother earth, and am ready for any mischief. Benno, do not look so dejected; I cannot stand it."

"If you had, like me, to walk always at the same hour you would look so too," replied Benno, stopping before an empty water-tank, in which four little bears were sitting, looking at the public, who were throwing bread to them. The Hereditary Prince took a piece of bread from the keeper, who approached him hat in hand, and threw it mechanically to the bears. "And if you had by high command to show yourself every day as the friend of the people, and feed these stupid bears, you would also weary of them."

"Pooh!" exclaimed Victor, "it only depends upon yourself to make these louts amusing."

He sprang with one jump into the walled place among the animals, laid hold of the first bear as a sheep is carried to be shorn, threw it upon the second, and the third upon the fourth; a horrible growling and clawing began among the bears; they fought violently together, and the bystanders shouted with pleasure.

"Your hand, comrade," called out the Prince, to one of the spectators, who were watching him and giving vent to loud expressions of approbation. "Help me out."

The person called upon was our friend Gabriel, who held out both hands.

"Here, your Excellence, quick, that they don't catch your uniform."

Victor sprang lightly up, giving his supporter a slap on the shoulder.

"Thanks, comrade; if you ever get into a fix, I will lend you a hand too."

The people cried "Bravo!" with much laughter.

"You must force life into the place," said Victor. "If your father does not drive me away, I shall in a week make it as lively at your Court as I have done here in the bear-pit."

"I, meanwhile, have suffered for it," replied Benno, with vexation; "one man said to another, 'What a pity that that fellow has not as much courage!' of course meaning me."

"Never mind; you are the wise one. In the eyes of thoughtful people, your virtues shine bright when placed in contrast with mine. Now let me into your confidence. What lady of the theatre do you favor with your attentions, that I may not be in the way? I do not wish to interfere with you."

"Nothing of this kind is permitted me," replied Benno.

"Not permitted?" asked Victor, astonished; "what kind of tyranny is this? Has it become the fashion here to be virtuous? Then impart to me, at least, what other lady, from political reasons, may only be admired by me in the distance?"

"I believe that you have free choice," replied Prince Benno, depressed.

"What a blessing for me that I am not Hereditary Prince! But what has occasioned the Sovereign to invite me here so graciously?"

"We do not know; Siddy also was surprised."

"And I, fool, thought she had a hand in the game."

"If she had attempted anything of the kind, you would assuredly have had no invitation."

"That he does not like me is evident. I had a cool reception."

"Perhaps he wishes to have you married."

"To whom?" asked Victor, quickly.

"He has caused you to visit amongst our relations," replied the Hereditary Prince, cautiously.

"He? By no means. I was passed on from one to another, and everywhere treated like a nice boy. The whole was perfectly concerted."

"Perhaps one of our great matchmakers was at the bottom of it," said the Hereditary Prince.

"Not in my case, depend upon it. I am ill looked upon by the conclave of mothers of our country, who have in charge the feelings of our princely families. They would not stir a finger for me."

"If my father has not done it, or none of our relations, the Lord High Steward must have done it."

"Bless you for this supposition," exclaimed Victor.

"If he wishes to have me here then all is right."

"Have you spoken to him?"

"I have been with him; he talked to me about the campaign, and spoke in his usual friendly way, but nothing more."

"Then it was he, you may depend upon it."

"But why?" asked Victor. "What can I do here?"

"That you must not ask me; he favors me with little of his confidence."

"Why do you turn away from the pavilion at every bend in the path?" asked Victor. "Have you placed steel traps there? By Jove, what a glorious face! Look, you dissembler! So, you are become virtuous?"

The Hereditary Prince colored with indignation.

"The lady up there deserves the most considerate treatment," he said, moodily.

"Then that is the beautiful stranger," cried Victor; "she is reading. If she would only turn a look this way, that one might see more than her profile. We will go there; you shall introduce me."

"Under no circumstances," replied the Hereditary Prince; "least of all now."

Victor looked at him in astonishment.

"You refuse to present me to this lady? I do not need it," and he let go his arm.

"You are mad!" cried the Hereditary Prince, holding him back.

"I was never more in my senses," rejoined Victor.

He hastened up to a tree, the low branches of which nearly reached to the window, and with the agility of a cat he climbed up to the top. He looked up and perceived the Hereditary Prince, and an officer climbing up a tree. She withdrew from the window. Victor broke off a switch, and touched one of the panes. A bell rang, a window was opened, and Gabriel looked out.

"Always in the air, your Excellence?" he cried out; "what are your Excellence's commands?"

"Tender my respectful compliments to your mistress, and request her to favor me with a moment's interview upon urgent business."

He appeared, with her usual serious countenance, at the window, the servant behind her. The young gentleman held on fast by one hand, and raised the other to his cap.

"I beg your pardon, Madam, for choosing this unnatural way of presenting myself to you, but my cousin down there has sent me up here against my will."

"If you fall, Sir, you may take with you the full conviction that it was unnecessary to climb the tree: the door of the house is always open."

He retreated, and Victor bowed again.

"The lady is quite of my opinion," he cried out, reprovingly, to the Hereditary Prince, "that you have done very wrong in keeping me from the door."

"There is no way of getting out of this scrape but by going in at once, and apologizing," replied the Hereditary Prince.

"That is exactly what I wish," cried Victor. "One must always let people know what they want."

(To be continued.)

## BOOK REVIEWS.

INVENTARIUM EINER SEELE. By R. von Suttner. Second Edition. Leipzig: 1888. W. Friedrich.

Baronin B. von Suttner is one of the most forcible authors in German literature. Her special field is the Novel and she discusses every subject in a philosophical spirit. The present book shows an unusual facility of treating psychological topics in a popular way. 'The Inventory of a Soul' is not that of her own soul; but of a man, as hundreds may exist. Madame Suttner is of aristocratic birth, but she has freed herself from the prejudices which so often attach to rank, and professes openly her faith in the new ideals of progressive humanity. The book contains many thoughtful passages, of which the following one may be quoted:

"We look at a portrait of ours taken in early youth and we ask with a regretful murmur upon our lips: 'Was I really so pretty?' We read a long forgotten poetic effusion dating from the same period of life and we often ask: 'Was I really so silly?'"

"Fortunately our mental parts do not fade away like the corporal beauty of youth: every new experience, every newly-thought idea furrows the forehead with a fresh wrinkle and enhances the worth and extends the power of the mind. And so at the sight of our faded photographs and tattered letters, we too will feel the desire: 'Ah, that I now could look as I did then!' yet scarcely ever say: 'Ah, that I could now write as I wrote then!' People who lament over so-called 'lost illusions' and wish back the ingenuous simplicity of their former ways of thought, are in a stage of transition merely, which at some time or other, when they have attained perfect clearness of mental vision, they can only smile at."

The *Art Amateur* for January gives us a foretaste of possible enjoyment in its description of the Metropolitan Museum of New York. The noble building and beautiful halls are well filled with objects of art and of decoration, while the Loan Collection offers treasures of modern art from many private galleries.

Greta reports from Boston very handsomely of the collection of prints, etchings, and drawings of Albert Driver, arranged by Mr. S. R. Koehler, and speaks well of Miss Whitney's statue of Lief Ericson. We should be better pleased with a serious criticism—however severe—of the Exhibition of Water Colors by Women than with the smart style of comment which better befits the hasty paragraph in a newspaper than the columns of an Art Journal.

The Exhibition of the Academy and the work of American Etchers are carefully noticed in detail.

The lively "letter to a young lady who asks if she can learn china painting," although she cannot draw, is full of good suggestions. We hope she will read between the lines, and see that she had much better learn to draw, if she wishes to do any work of value.

The section on Amateur Photography is always welcome to those engaged in this fascinating work, which is doing a great deal in bringing out interesting effects and in transcribing the phenomena of nature for future use in Art.

The number is an interesting one. We feel grateful to the editors for going steadily on with their work through the holiday season, instead of devoting their space to subjects only appropriate to the time.

## NOTES.

Horace C. Bennett delivered a lecture "No Sin, No Crime" at the Chicago Secular Union on Saturday last. He criticized the present attitude of our legal institutions toward criminals.

Chas. A. Wenborne, successor to Moulton, Wenborne & Co., of Buffalo, N. Y., will publish an authorized American edition of Laurence Oliphant's latest work, 'Scientific Religion, or Higher Possibilities of Life and Practice.'

Mr. Wm. M. Salter's interesting lecture, "Christmas From An Ethical Standpoint," is now published in pamphlet form. Address, C. J. Errant, 24 Beethoven Place.

Mr. Daniel Greenleaf Thompson, the new President of the Nineteenth Century Club, is about to publish an enquiry into the fundamental principles of social ethics, and a discussion of the trend of social evolution. The title of the work is: "Social Progress," to be issued shortly by Longmans, Green & Co. Mr. Thompson declares his belief that social progress can be attained only through the perfection of social liberty.

In a lecture upon "The Philanthropic Work known as 'The New York University Settlement, and the Project for University Extension Lectures,'" Dr. Morrison I. Swift discusses the efforts on the part of the educated and prosperous to reach the lowest classes through such movements as the "Toynbee Hall" and "People's Palace" in London, and the Forsythe Street Work in New York City, in which Dr. Swift has taken an active part. Dr. Swift is a contributor to THE OPEN COURT, and an essay by him appears in the present number, discussing the education of the youth of to-day as preparatory for the work of life.

We are in receipt of a delicate piece of literary criticism by Dr. Daniel G. Brinton, of Philadelphia, entitled: "Facettes of Love: from Browning."—being the Introductory Address at the Opening of the Browning Society of the New Century Club, of Philadelphia, November 12, 1888. We quote from it the closing remark of Dr. Brinton, which we find to express a thought that THE OPEN COURT strives to realize. "I once wrote a book," says Dr. Brinton, "upon that sentiment which prompts man to make for himself religions and to satisfy his mind about such things as soul, God, immortality, and the like. I closed the volume with the prediction that he will attain such satisfaction 'only when he rises to a practical appreciation of the identity of truth and love and life.' Some critics passed on these words as meaningless. They yet lack philosophic development. Nevertheless, I repeat them in closing this address, and I leave it to you to decide whether they do not embody the highest teachings of the two greatest poets of the Victorian age, Browning and Tennyson; and as I turn their jewelled pages I feel borne in upon me the truth of those sweet and wise words of Plato: 'He who is led by the touch of love walks not in darkness.'"

Ex-Governor Koerner, of Belleville, Ill., writes to us: "In a book entitled 'The Art of Conversing with Men,' by Baron von Kniggy, first appearing in 1778, and since then republished in several editions, and which at the time made such a sensation as to be translated into nearly all civilized languages, the author devotes in conclusion a chapter regarding men's treatment of animals, of which we give the following passage, as proof that *Evolution* seems to have been in the mind as a vague idea at least of many thinking persons: 'If people who so often wantonly torment animals would consider that they have been created by the merciful father to supply our wants, and that no living being has a right to sport wantonly with the life of a fellow creature; that an animal is possessed of as acute feelings of pain as man and perhaps is affected even more sensibly by tortures than ourselves, because its whole existence is generally believed to depend upon sensual feelings; that this existence perhaps is the first step which it takes upon the scale of creation to ascend gradually to the state in which we are, and that cruelty against the brute creation imperceptibly leads to cruelty against our rational fellow creatures.'"

[We must add that the general conception of evolution was more common to the end of the eighteenth century than is generally supposed, and Mr. Koerner's quotation is proof of this fact. One of the first advocates of man's origin from an animal existence was Herder.—Ed.]

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, President.

DR. PAUL CARUS, EDITOR.

THE READER will find in *THE OPEN COURT* an earnest, and, as we believe, a successful effort to conciliate Religion with Science. The work is done with due reverence for the past and with full confidence in a higher future.

THE OPEN COURT unites the deliberation and prudence of conservatism with the radicalism of undaunted progress. While the merits of the old creeds are fully appreciated, their errors are not overlooked. The ultimate consequences of the most radical thought are accepted, but care is taken to avoid the faults of a one-sided view.

## THE QUINTESSENCE OF RELIGION

is shown to be a truth. It is a scientific truth (a reality) which has been and will remain the basis of ethics. The Quintessence of Religion contains all that is good and true, elevating and comforting in the old religions. Superstitious notions are recognized as mere accidental features of which Religion can be purified without harm to the properly religious spirit.

This idea is

FEARLESSLY AND WITHOUT RESERVATION OF ANY KIND.

presented in its various scientific aspects and in its deep significance to intellectual and emotional life. If fully grasped, it will be found to satisfy the yearnings of the heart as well as the requirements of the intellect.

Facts which seem to bear unfavorably on this solution of the religious problem are not shunned, but openly faced. Criticisms have been welcome, and will always receive due attention. The severest criticism, we trust, will serve only to elucidate the truth of the main idea propounded in *THE OPEN COURT*.

#### RATES OF ADVERTISING.

For Each Insertion, without choice of position, per line.....	\$ .10
" " " " " " per column.....	12.00
" " " " " " per page.....	20.00

ERNST MACH

Ernst Mach (Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch) explains in his essay *Transformation and Adaptation in Scientific Thought*, (in Nos. 46 and 48), one of the most characteristic ideas of modern science—an idea that lies, so to speak, in the atmosphere. "Knowledge," he says, "is an expression of organic nature." The law of evolution, which is that of transformation and adaptation, applies to thoughts just as well as to individuals or any living organisms. A conflict between our customary train of thought and new events produces what is called the problem. By a subsequent adaptation of our thought to the enlarged field of observation the problem disappears and through this extension of our sphere of experience the growth of thought is possible. Thus the happiest ideas do not fall from heaven, they spring rather from notions already existing. From this standpoint the narrow conception of egotistic views disappears. "The person" is comparable to an indifferent and symbolical thread on which are strung the real pearls of life—the ideas that make up the changing content of consciousness. Humanity in its entirety is like a polyp plant; the material and organic bonds of union have been severed, but by this freedom of movement, the psychological connection of the whole has been attained in a much higher degree.

PROF. E. D. COPE.

In Number 33 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the idealist to deny the existence of matter. The materialist bemoaning the imperfection of the senses may pronounce them to be one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

WILLIAM I. POTTER

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishism is means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

## HENRY GEORGE AND LAND TAXATION.

BY WHEELBARROW.

What a glorious idea: the fatherhood of God, the brotherhood of man, and a millenium on earth by the simple means of a single tax on land! That is the promise contained in Mr. Henry George's doctrine, so brilliantly set forth in his *Progress and Poverty*. I have read the book—nay I have devoured it. There was so much truth in it, and, alas! so much impossible fairy-land that I began to doubt. It is a most fascinating work on political economy, and I am under the spell of its eloquence still. The line of demarcation between reality and dreamland is not easily drawn where both are so closely blended.

The book contains a doctrine which I learned from somebody, or some book, many years ago, and which still clings to me, although entangled with many misgivings. It is that of abolishing the tariff and the whole system of indirect duties, and putting all taxes on land. I am told that the idea was first proposed by the French economists called physiocrats, who conceived the directest way of taxation the best. They compared the social growth of a nation to that of a tree which derives all its sap and strength from the roots. The roots are agriculture, the stem is the population, the branches are the different industries, the leaves are commerce, and the blossoms are the sciences and arts. If but the roots are sound, let nature take care of the rest. The leaves, the blossoms, and the fruits, how distant they all appear from the roots! and yet they are all in closest connection; the leaves draw all their juice from the roots. There is no need of protecting the leaves for the sake of the roots; and even if branches are torn off by the storm, the injury is not serious, and the work of restoration immediately begins if the roots have not suffered.

While Mr. George's enthusiasm animates and encourages me, I think I can see a flaw in his policy. I believe in the justice and practicability of land taxation. Let land be taxed according to its value, and remove the many duties on other quarters which are obstacles to progress and weigh heaviest on the poor. I have no other argument for my view than that it seems to me not unjust, and not impracticable. My proof would be a fair trial. I trust it will work well and commend itself especially to those who start in

life. As land would lose in value, if burdened with taxes, it would afford to a poor man a greater opportunity to take to farming. All machinery and other products of industry would be cheaper, if the prices were not, as is the case now, artificially raised, so that a full dollar in the United States goes on every seventy or sixty cents, or even less, in England and in the world's market. Money would be dear, and if a little dear money-buys much goods, a start in life will be easier in every field.

So far as land taxation, its justice and practicability are concerned, Mr. George and I travel together. But almost from the beginning in Mr. George's arguments our roads part. I believe that a radical defect in this plan lies in the mistake that a tax may be converted by political magic from a burden to a blessing. Taxes may be unwisely and unfairly levied, and the burden of them thereby increased; but in their wisest and most virtuous form, they are a burden at the best. Believing this very important premise of his argument to be an error, I doubt the economic soundness of his conclusions. To the man who buys land, it will be a boon to have it on easy terms, but to the farmer who owns his farm, land taxation will always be felt as a burden.

But there is another fundamental error. Mr. George calls his book "*Progress and Poverty*," and denounces every progress under present circumstances as driving a parting wedge between the rich and the poor. Every progress, he maintains, benefits the rich only, it makes them richer and oppresses the poor worse than they were before. This Mr. George has not proved, and there is little probability that he ever will prove it, for it is not true and very likely the contrary may be proved most easily. Progress is always beneficial to the poor as well as to the rich. A poor man would consider himself wretched now if he did not enjoy certain comforts which were luxuries in former days.

The arguments upon which Mr. George builds his system are patriotic and humane. He bases it on the idea of the fatherhood of God and proclaims that the earth is God's impartial gift to all the children of men. "It is in the scripture, Trim," said Uncle Toby. So Mr. George believes that "The earth is the Lord's and the fulness thereof," and from that sublime text he preaches a very old agrarian gospel in a newer

form of words. It is possible that our Saxon ancestors when they took possession of Britain cherished similar ideas, as did the children of Israel in the time of Moses. Whether they did or not, they certainly acted in that way; they abolished the land monopoly, these of the Cananites and those of the Britons, and both of them established another land monopoly of their own. They took possession in the name of their gods, and when the Normans invaded England they also came in the name of the Lord, for the Pope had blessed their leader's sword.

All these arguments from beyond the clouds are of a very doubtful nature and we should not employ them so long as we have other arguments which are more palpable and not so sentimental. Wherever they are employed I am apt to be prejudiced that there is something wrong; and if the cause for which they are used is not wrong, there must certainly be a lack of proof or a flaw of logic in the man that argues.

Mr. George makes a difference between Land, Capital and Labor. Land is the condition of our existence as well as of our labor. Labor creates all values, and capital is as it were, stored up labor.

Mr. George points out the difference between land and capital, but he loses sight of the fact that land in itself and apart from labor has no value whatever. It acquires value only by the application of labor. It is true that an unimproved lot in the city has value, but what is that value otherwise than the labor of those who live there. I agree with Mr. George that that value should be taxed, but even in this case it is labor that is taxed, and not the land. I would not buy a hundred square miles of most fertile land in Central Africa for a dime if it could be had for that price, because it is useless; it is without value so long as there is no hope to make it valuable through labor. If only land should be taxed apart from improvement, many lots on the lakeside of Chicago should be free of taxation, for they consist of improvement only. The Dutch people should be free from all taxation, the districts where swamps have been before ought to be a forbidden ground to tax gatherers. In truth all lands under cultivation are like Holland, they have been gained or improved by labor and the sum total of their labor value is rarely covered by their market value. If only land should be taxed apart from improvement, as Mr. George proposes, this would be an abolition of taxation altogether.

While the basis of Mr. George's theory is vague and unsubstantial, the consequences which he prophecies to follow are fantastical. It is the abolition of poverty and the beginning of a millenium upon earth.

Mr. George's optimism is enviable, it is like that of a child. Here he places himself in one and the same line with the many other reformers that have

found a panacea for all evils in the world. But the promises are so positive, that Dr. McGlynn says, he would not hesitate, if he could, to introduce at once such changes as would realize this single tax theory. Does the Doctor forget that all sudden changes must bring about a most dangerous crisis. Even a sudden change for unmixed good may be fatal. A consumptive person has to be accustomed to good air by degrees, and a half-starved man must take his first meal by small bits. Moreover, are not those who have invested their capital, *i. e.*, their stored-up labor in land, entitled to be protected in their possession acquired under our present system. Is it just to deprive a farmer of his farm which he has bought with the toil and sweat of his or his fathers' life?

These difficulties are not insurmountable, although they must for a time impede the introduction of land taxation. Land taxation can easily be introduced by slow degrees, and a compensation may be given to those who would suffer unfairly by the change. But even granted that the advantages of land taxation would be great, I fail to see how it can produce such a glorious state of things as Mr. George hopes for.

Is he so utterly blind to the fact that poverty has many sources, (of which I confess our wrong system of taxation is a very important one,) and that after the removal of this, there are a hundred others to fight? If there is one chief source of poverty we should not seek it in circumstances but in man. The savage is dependent upon circumstances, but civilized man should be able to govern circumstances, and use all his mental and moral powers to make the best of his situation by wise foresight, economy, thrift, and industry, instead of letting things go until circumstances have improved. I know of one panacea only; it is man's obedience to the moral laws. But the application of this rule, simple though it sounds in its generalized form, is so complex that it hardly deserves the name of a panacea. Land taxation even if it had in its consequence all the impossible blessings it is supposed to have according to Mr. George, would be of no avail to him who believes that he is the mere product of circumstances, and who does not know that a man's character is the most important factor among the conditions that shape his fate. If a man is aware of that, he will dare to become the master of the circumstances that surround him. The most urgent step forwards is the moral elevation of man, and progress is no progress unless it is accompanied by a moral progress of man that makes him stronger and more humane.

#### THE SELF-EVIDENT.

BY DAVID NEWPORT.

The new translation of the Old Testament has restored the Hebrew reading of Psalms VII, 5: "Thou

hast made him (man) but little lower than God, and hast crowned him with glory and honor," and the scriptures largely treat of "the angel of the Eternal" as the soul-life posited in man, and of all contrary to this as being of the adversary. Jesus speaks, we read, of the divine nature in man as something which is correlate, in "continual" correspondence with Deity—"Their angels do continually behold the face of the Heavenly Father." This doctrine I hold to be the quintessence of the thought of Jesus, and would inquire whether it is not something which we can apply to our experience, and know that what the great Artist has said is true: "There is a divinity which shapes our ends, roughhew them how we will."

Now, the consensus of finite intelligence is so constituted that it regards as a waste of effort all attempts to demonstrate that which is self-evident; and Infinite Power is one of those self-evident facts which all *intelligent* men perceive,—infinite energy asserting itself in all things each day of our lives! It is also evident that there can be no increase to infinite power, and that the only limit which can be assigned to it is self-limit. In other words, that there cannot be two infinite powers, as that would imply what in the *nature of intelligence* is self contradictory, and therefore is absurd and unthinkable. Infinite power must hence be without "*variableness or shadow of turning*," and is eternally the same in itself, and in all its effects. But finite or *derivative* power, and intelligence, is conscious of increase in knowledge and in intelligence. Man is constantly converting the unknown into the known—has a wonderful facility for progress, increase, and evolution; he is continually finding out that which in phenomena is new (original) to himself. Amongst his faculties is the faculty of *awareness*, wherein he knows that all his powers and faculties are derived powers and faculties; consciousness in him not only proves that he is an intelligence, but also that he is an inhabitant of a universe of infinite intelligibility, *in which he is being developed!* He knows that he is not a first cause, but that he is an effect from an infinite cause and power: he knows something of his genesis, and of the impact of the two instrumental causes which called him into conscious physical being, and is aware of the persistency of that being,—that through the annual total changes of his animal body, that he *persists* in being only himself!

He knows of the possession of a common consciousness, and of a religious (spiritual) consciousness, and he is aware herein of being evolved (developed), by a power not himself which makes for consciousness, as well as for righteousness; and thus he knows that he possesses a moral nature, as well as a spiritual nature. And herein let us apply a criterion of that great and good man John Woolman, who wrote thus one hundred

years ago: "There is a Principle, which is pure, placed in the human mind, which in different ages and places hath been called by different names; it is however pure, and proceeds from God. It is deep and inward, confined to no form of religion, nor excluded from any, where the heart stands in perfect sincerity. In whomsoever this takes root and grows, they become brethren." It may be objected that in this citation I am wandering away from the self-evident; but if this be the case, this is one of those truths which comes to man by reason of development and evolution, and hence belongs to his capacity and nature by reason of affinity and assimilation, and a man is as his affinities are! But let us keep to what Herbert Spencer calls the "common consciousness" or what the Apostle calls "an animal man," which man needs development, and evolution, in order that he may become a "spiritual man," and thus come to that condition of *awareness* wherein he knows of a "pure principle" within himself which "*proceeds from God*."

We have seen that infinite power comprises all power, and therefore admits of no power operating upon it, or external to it. Infinite space proves this, as it comprises all space; and as a portion of space is a part of infinite space, so is the finite a part of the infinite, or of the ALL!

Infinite power, then, includes all finite power and its issue, because every effect must inhere in its cause; therefore the process of evolution—unfolding!—is but the action of infinite power upon the derivative and finite—man's ideas and discoveries not being original, as he is only finding out more and more of the infinite and of the eternal. This being true, therefore infinite power must also be infinite intelligence, because of the reason just assigned, that infinite power includes all power, and therefore all intelligence; *Infinite Intelligence being thus self-evident to finite intelligence!* He being revealed by Himself, as are all things which He has produced, each thing by itself, to intelligent, conscious man!

And when we get rid of the idea of a Creator in the sense that there ever could have been a time when cause was and effect was not, then we come to the true idea of infinite intelligence, from whom we derive impress, likeness, and being. When we come to this through what Herbert Spencer calls "the religious consciousness" (which is a self-evident power in man); when subject and object coalesce through affinity: then man becomes endowed with spiritual mindedness. He lives to God, and thus he becomes possessed of God-power, and receives thus an endowment, and becomes identified with that principle which dwelt in Jesus of Nazareth, which is the eternal Christ of God. In such a man the two worlds meet, he is now a representative of both, and becomes acquainted with the

narrow way and strait gate which leads unto that life which the man Christ Jesus symbolized as "the Way." It was over this lack of spiritual vision that Jesus wept,\* and on account of which "he went up into a mountain apart to pray; and when evening was come he was there alone." He prayed unutterable prayers that the eyes of their souls might be opened so that they might realize Christ within, and thus, experimentally, through development, become acquainted with that *power* which dwelt so richly in him of Nazareth! And this *power* is divine power, or divine inspiration, and is as universal as man is universal, and is a *self-evident fact to all men who live in infinite intelligence*. Suppose that this power in man as a finite and derivative being is in embryo only? What does this prove? Why, it only proves his possibilities, his capacity, his nature for increase and evolution, and that he is thus what the All is, absolutely.

Latent and invisible the divine seed may be, yet it *never ceases to progress*,—to evolve, to unfold, and therefore it is immortal, and survives that appearance which men call death!

Jesus told the Jews, "Ye understand not the scriptures, or the power of God." And one great cause of the irreligion which exists, is in thus misunderstanding Infinite Power; expecting it to do for us that which is inherently impossible, as God is self-limited, for the reason, as we have seen, that there can be but ONE infinite. The old idea makes him a very poor workman—"making man and then repenting having made him, etc., etc." Now as there can only be one infinite, all things have, of necessity, to be finite and derivative, and to suppose that it could be otherwise, is to be absurd. How much man has perplexed himself over the enigma of evil, as to *how* it came into the world? Now all things which proceed from the Infinite, are simply *minus* the infinite, and in this sense only they are imperfect; for perfection alone is the attribute of the Infinite. In the infinite variety of effects which flow from the infinite cause, from eternity to eternity, all are good in the sense of the "*restoration of all things*"; finite beings seeing only in part—the All they cannot see!

"God loves from whole to parts; but human soul  
Must rise from individual to the whole."

To the mind of the All, evil cannot be an end, it is simply an incident in the endless variety which flows from the Eternal Mind. Man is so constituted as to feel keenly the evil to which he is subjected in this world; and death is the *sum* of all evil to him. And he becomes victorious here only when he sees in this "*the restoration of all things*,"—when death becomes a passport to a higher and better life,—when he pos-

sesses the *knowledge to believe* that he is *being perfected* in the endless processes of Infinite Intelligence; then, and only then, can the problem of evil be solved to him in an endless "*restoration of all things*," which in other language means that man has an unending and an immortal capacity for increase, progress, and evolution, and never ceasing to progress, he of course survives the grave, and is immortal.

The Philosopher (the Friend), is a Phenomenist and a Noumenonist also, and hence he sees not only with his eyes but with his soul also; and above all he is an Optimist,—he perceives that our nature it is that makes us what we are, and that if we were different from what we are we should be other beings. Man is as he is, if he were different he would not be man! And his progress proves that remedial means are being constantly applied to his environments, to correct them,—that he may outgrow them (errors and wrong), and thus be constantly putting off inferior conditions, and putting on superior—thus to become in time what Confucius called "The Superior Man"! And the superior man does not foolishly charge Deity with not having done the best He could in the production of man, and of all things which have "come forth and proceeded from Him;" on the contrary he *co-operates* with Him, and with His divine order, in its evolutionary processes for the elevation of man and for his immortal unfolding!

Socrates in speaking of the divinity in man, The Soul, said that it was "modeled after the eternal idea of the good, the true, and the beautiful." And that wonderful man of the Elizabethan age, thus discoursed concerning him:—"How noble in reason! how infinite in faculties! in form and moving how express and admirable! in action how like an angel! in apprehension, how like a God!" After a period of depression and "inward sufferings," the prophet George Fox "saw the infinite love of God." "I saw also," he writes in his journal, "that there was an ocean of darkness and death; but an infinite ocean of light and love, which flowed over the ocean of darkness. In that I saw the infinite love of God, and had great openings." And Whittier discoursing upon this theme thus sings:

O Beauty, old yet ever new!  
Eternal voice and inward word,  
The Logos of the Greek and Jew,  
The old sphere-music which the Samian heard!

Truth which the sage and prophet saw,  
Long sought without, but found within,  
The law of Love beyond all law,  
The Life o'erflowing mortal death and sin!

Shine on us with the light which glowed  
Upon the trance-bound shepherd's way,  
Who saw the Darkness overflowed  
And drowned by tides of everlasting day.

\* "And he groaned deeply in his spirit, he says, Why does this generation seek a Sign?" Mark viii. 12.

## THE UNIFICATION OF RELIGION AND PHILOSOPHY.

BY M. C. O'BRYEN.

"All scripture," writes the apostle Paul,\* "is given by inspiration of God." This claim is nearly identical with that which the Brahmans of India advance "to establish the divine origin and the absolute authority of the Veda."† The general public opinion of Americans notwithstanding, it is by no means a novel, certainly not a unique pretension. Arranging them as nearly as possible chronologically, we have the following order of Scriptures or sacred books of mankind: (1) the Veda, the Bible of Brahmanism; (2) the Zend-Avesta, the Bible of Zoroastrianism; (3) that portion of the ancient Hebrew legislative writings containing codified laws or ordinances which modern exegesis has identified with the most marked legislative stages in Hebrew history; (4) the Taote-King, the Bible of Taoism; (5) the Tripitaka of the Buddhists; (6) the New Testament of Christianity; and (7) the Koran of Mohammedanism. To show that the inspiration attributed by Paul to the sacred books, the hagiography of his own race, has also been claimed for the Veda and Zend-Avesta, I will once again have recourse to one who on this matter is able to speak "as one having authority." Writing of the Brahmans, Professor Max Müller affirms that "they maintain that the Veda existed before all time, that it was revealed by Brahma, and seen by divine sages, who themselves were free from the taint of humanity.... The Brahmans, in order to meet all possible objections, have actually imagined a series of sages, the first quite divine, the second three-fourths divine and one-fourth human, the third half divine and half human, the fourth one-fourth divine and three-fourths human, the last human altogether. This Veda, then, as handed down through this wonderful chain, is the supreme authority of all orthodox Brahmans. To doubt the divine origin and absolute authority of the Veda is heresy."‡ But little less supernal, comparatively, was the origin claimed for the Zend-Avesta, the medium of this revelation being "considered worthy of a personal intercourse with Ormuzd; he receives from Ormuzd every word, though not, as Dr. Spiegel says, 'every letter of the Law.'"§ We need not further allude to this matter, since the fact that a divine origin is claimed for other revelations than the Christian may be said almost to be universally recognized. The comparison and collocation of alleged theophanies have only been made to convince the perhaps timorous inquirer that in this question of the settlement or definitive disclosure of religion we have no other guide to direct us than reason. In Butler's "Analogy of Religion,"—which is the

only philosophical theodicy or God-justification extant in our language,—we find it expressly stated that "Christianity is a scheme quite beyond our comprehension," while the late Canon Mozley affirms of that proof of a revelation which is contained in the substance of that revelation that "it cannot reach to what is undiscoverable by reason."

Here, then, we meet with a serious check *in limine*, on the very threshold of any proposed investigation of religion in accordance with the scientific method. We are brought face to face with ἀκατάλητοι or "incomprehensibles" like those which the Athanasian creed dares us to refuse or reject on the peril of everlasting perdition. We have, however, learned long since that with respect to human knowledge the proverb holds good: "nothing venture, nothing have;" we risk the anathema or the excommunication, holding, as we do, that for all things known and unknown, the commonplace and the apparently transcendental, man is or will be able to furnish a rational explanation. If it be sound theology to assert, as does Mozley, that what transcends human reason cannot be proved or disproved by human reason, it is no less sound philosophy. Given man as the centre, the universe, infinite though it be, is the periphery; but there is nothing in the word *infinity* or *eternity* so awful or so tremendous that the abstract thinker need despair, that ultimately human reason will be transcended at all. Herbert Spencer, arguing for the relativity of knowledge, arrives at the conclusion that "the reality existing behind all appearances is, and ever must be, unknown."¶ And Sir W. Hamilton says with respect to the impossibility of ultimate knowledge: "With the exception of a few late Absolutist theorists in Germany, this is, perhaps, the truth of all others most harmoniously re-echoed by every philosopher of every school."‡ If it be a truth it is, and must necessarily be, a very pitiful one. "All that we know is, nothing can be known!"

*Scire nihil—studium, quo nos latamur utriusque.*

Surely the terrestrial Nirvana of the arch-pesti-mist, as conveyed in the formula of "the denial of the wish to live," would be the logical outcome of Agnosticism *in excelsis*. Yet it seems to me that both the Conditional and the Absolute philosophers appear like unskillful swimmers (*rari nantes*) in a vast whirlpool. Let us for a moment examine their formulæ or watch-words. The Absolutists say, *Noscendo cognoscitur, ignorando ignoratur*,‡ the Relativists affirm, *Noscendo ignoratur, ignorando cognoscitur*.§ These antinomies have perhaps a certain scholastic sound, but in reality they throw no light whatever on the subject of absolute and relative knowledge, being of no greater value

\* II. Tim. iii. 16: θεόπνευστον, God-breathed or inspired.

‡ "To knowing it is known; in not knowing it is not known."

§ "In knowing it is not known; in not knowing it is known."

in this respect than would the knowledge of *barbara, celarent, bekardo, bramantip*, or the other moods of the syllogism to an opposer of Home Rule in the Parliament of Great Britain. Assuming that the universe is man's periphery,—and with respect to man, the assumer and observer, what other alternative assumption is open?—then its centre is man, and to each individual of the race, whether wise or foolish, learned or illiterate, the kosmos-centre is his own consciousness, his own egoity. This egoity, so far as individual determinate consciousness is concerned, can have no appreciable connection with non-recognizable things or no-things, that is to say,—as does the Bampton lecturer,—with those *incognita* which “lie beyond human reason.”\* In this dilemma what course are we to follow? One can hardly avoid thinking of that old syllogism which has for generations done duty in so many text-books of logic: “All oriental histories are difficult to expound: the Bible is an oriental history: therefore, the Bible is difficult to expound.” If we can neither comprehend nor by the use of reason discover the “ways of God to man,” who is to prescribe for us the direction in which our faith shall be exercised? Must we be content with the religion of our parents, with the creed of accident and of circumstance? In that case Brahmanism, Zoroastrianism, Judaism, Christianity, and Mohammedanism are equally imperative; so that the only test of intrinsic merit would be a relative one, to be modified and affected by considerations of latitude, of climate, of customs, and of physical necessities.

With the utmost respect for the memories of Bishop Butler and Sir William Hamilton, I refuse to acknowledge the *ne plus ultra* either in religion or philosophy. It is certainly true, as D'Holbach said, that in abandoning experience, or the lessons of experience, to pursue imaginary systems, man invariably deludes himself. “He is the product of nature, he exists in nature and is bound by her laws, from which he cannot deliver himself, and beyond which he cannot range, even in thought. All in vain would his mind soar away from the visible world; necessity, imperious necessity, compels him to return.”†

It is certainly true that man exists in nature, the all-generator, but it is equally true that nature exists in man; so that in this mutual connection and interdependence the all-generator becomes in turn engendered. It was Sir William Hamilton who wrote on the wall of his study, “In the universe there is nothing great but man; in man there is nothing great but mind,”—thus making the human standard the *supreme* criterion of all things. The raiment in which we hold things, even the very qualities or properties with

which we endow them are made by us, our own apparent physical conformation and anatomy being an apparition of the brain. To many readers of this paper, who are familiar with the “Critique of Pure Reason,” I need hardly say that the great German philosopher in considering the possibility of science or of “synthetic judgments *a priori*” insists on our recognition, as a primary essential, of the truth that “thought and things are not diverse or dualistic.” This, I take it, might be used by the absolute Idealist as a text, since it clearly identifies man's universe with man's egoity, while the context renders it impossible to dissociate what we term the subjective and objective phases of the mind. “The one (*thought*) does not exist apart from the other (*things*). Objects are not passively apprehended by the mind, as something distinct from it, but are actively constructed by it. Intelligence is present from the first in this creation.” What intelligence is present from the first? Our own, of course, not that of a Being external to ourselves.

We gather, therefore, from the passage just quoted that the all-mirroring is also the all-creating mind, and thus we are taken far back into the past, beyond Kant, Hume, and Berkeley, to the Protagorean ontology, to the simple yet sublime affirmation that man is the measure of all things. The revelation brought by this realization is, as Paul says of the Bible, God-breathed or inspired; but the Deity is incarnate in man, so that we may cry with the poet Swinburne—

“Glory to Man in the highest, for man is the maker of things!”

Such considerations are in one sense atheistic, but not anti-theistic, in their signification. They enable us to eliminate from the sphere of practical duty all accountability to an exacting Deity, they free the mind from the burden of anxious thoughts respecting a future existence independent of organization, and they induce the corollary that, since he is to himself the centre of the universe whose overpowering vastness is produced by his own cerebration, man must necessarily be the arbiter of his own destiny. The feeling of littleness acknowledged by Carlyle, and even by Kant in that well-known expression of supreme admiration of the stellar universe and moral nature of man, will not exist in the mind that clearly recognizes that if the universe be in us then God and,—as Jesus said,—the “kingdom of God” must also be within us.

*Est Deus in nobis agitante coelestinus ipse.*

It is, I venture to think, in this unification of the ego and the non-ego that philosophy will ultimately be firmly and finally established, and religion and science be reconciled. By unification I mean the actual recognition of the truth that the ego, the self, is an integral portion of all things, and that the All,—the twinkling stars which form the “poetry of heaven,” the waves of the ocean, the flowers and grass,—“in whom

\* Bampton Lectures, 1865.

† Quoted from memory.

we live and move and have our being," is also in us. This conception is surely as consolatory as it is undeniably beautiful, yet it is purely monistic or materialistic, for the Protagorean and Berkeleyan ontology, by which the whole universe is reduced to egoistic Idealism, cannot be dualistic. The recognition of the fact that mind is the function of a particular corporeal structure, that its *proplasm*, or condition precedent to all form as mind, is the human sensorium, reverses the whole of Berkeley's Immaterialism.

In one of his *ad captandum* lectures, Mr. Joseph Cook tells us that he once questioned "an expert," asking him "What is the cause of organisms?" receiving for answer that it was "life." Whatever we may think of the inquiry as illustrating the narrowness of imperfectly educated theologians of the Puritanic strain and their passion for first causes, what shall we say of the eminent physiologist who had thus apparently discovered manifestations or indications of life apart from that *materia rerum ex qua et in qua sunt omnia*, as Cicero puts it, who had found the *energeia* separate and distinct from that of which it was the proper function and outcome? Only a *savant* of the old pre-culture school of scientists, as known in England and America until very recently, would have been so ready to furnish Mr. Cook with so prompt a solution to the so-called "problem of life." If matter be eternal, its *vis insita* or universal accompaniment must also be without beginning, without intermission, without end, and between two eternals there can be no priority. Yet Simplicius has preserved a passage from Anaxagoras, which Lewes thus translates: "Intelligence is, of all things, the subtlest and purest, and has entire knowledge of all. Everything which has a soul, whether great or small, is governed by the Intelligence (*νοῦς ἀπ᾽ αὐτοῦ*). Intelligence knows all things (*πάντα ἔγνω νοῦς*), both those that are mixed and those that are separated; and the things which ought to be, and the things which were, and those which now are, and those which will be; all are arranged by Intelligence (*πάντα διεκρίσθη νοῦς*)."<sup>\*</sup> This Anaxagorean Intelligence is not, however, an anthropomorphism. Rather is it that Supreme Intelligence to which modern philosophy—patiently awaiting itself of the modern scientific method of inquiry and research—is directing us, the Infinite τὸ Πᾶν, the Supreme Intelligence, to whose great heart man will continue evermore to approximate, continuing thus evermore to mirror more faithfully in his own nature, in proportion as his knowledge increases, that which we may term God, and continuing age by age to increase the range of his conceptive and formative potentialities. We are not vainly, futilely pressing forward to glut the malevolence of a Sphinx whose

enigma may not be solved. To all things whatever we shall possess the master-key and rationale, and doubtless in all the religious systems of the past, in all their scriptures from the Veda to the Koran, we can trace these aspirations for a nobler, clearer future out of which all progress has come. The horizon is widening with every stage of our development, revealing both to the religious observer and the philosopher a *plenum* of which we ourselves are integral portions, but in which there is no duality of inert matter and immaterial vitalizing principle. Seen in this ever-increasing radiance, is not our sense of brotherhood to one another strengthened and intensified? Are we not really more religious because of this feeling of consanguinity to "every pulse of life that beats the air?" Immanuel—*God with us*—is a term to be applied with deeper, truer meaning than that of the prophet Isaiah, since the oneness or unification of man with all things in the universe, must tend to convert transubstantiation, consubstantiation, and other so-called mysteries of religion into open secrets. With countless millions of millions of millennia before us, perhaps, in the perpetuation of the race to which we belong, it is, at least, impossible to doubt, that by docilely observing Nature and human nature, satisfactory progress will be made, and every generation of men will advance farther and farther toward absolute happiness and perfectibility. Already, in the comparatively brief morning during which man has had a history to be related and transmitted, he has made sensible and encouraging progress from the era when three men were daily sacrificed upon the altar of Heliopolis; and, let what may betide, we may cherish the well-grounded conviction, that ultimately Ormuzd, or the principle of Good will triumph throughout the universe.

#### SUNDAY LAWS.

[COMMUNICATED.]

J. G. Hertwig, of Washington, D. C., is the author of a short pamphlet on *Sunday Laws*. It fully approves Sunday as a day of voluntary rest, for being as such in harmony with the wants of human nature, and with the Constitution of the United States. But it opposes and rejects all legislation establishing Sunday as a day of worship, in churches, and, in other respects, of enforced rest. It argues, that such legislation indirectly violates the full and absolute religious freedom and freedom of conscience, granted and guaranteed to the American people by the Constitution referred to, of 1787, including the Amendments added thereto, afterwards. It claims that social, moral, and mental education will prevent an improper use of a free Sunday in free America. In other words, it advocates full social freedom, on Sunday, in this country.

A short time ago, Mr. Hertwig wrote the fol-

<sup>\*</sup>"Hist. of Phil." Anaxagoras.

lowing note to Dr. Byron Sunderland and Dr. George Elliott, two prominent clergymen of the national capital:

DEAR SIR:—In view of the forthcoming convention of the American Sabbath Union in this city, and believing in the words: *Audiat et altera pars*, I take the liberty of sending you, together with these lines, a copy of a pamphlet on *Sunday Laws*, written by me, *sine ira et studio*, several years ago. It is a legal argument and does not discuss theology.

Hoping that you will not feel offended by my liberty, I am,

Very Respectfully Yours,

WASHINGTON, Dec. 9, 1888.

J. G. HERTWIG.

This note was answered by the following letters which are published here with the permission of all parties concerned:

DEAR SIR:—Though personally a stranger to you, I wish hereby to acknowledge with thanks the reception of your note and pamphlet on the "Sunday Laws."

It is well to hear all sides on a question of such vital consequence, especially when men's views are presented calmly, and dispassionately, and without ribaldry or scurrility.

So I have been interested in your treatise on the Sunday Laws from your standpoint.

But you must know, that your views on the Sunday question differ very materially from those of the prominent men of the Revolution, and the framers of the Constitution, which instrument recognizes "Sunday" in specific terms as the Christian Sabbath, an institution then existing and already established among the people, and which was then and has been to this day held in legal phrase as a *diei non*.

I would remind you of the address of the Congress of 1779 to the people of the United States, of the action of the Provincial Congress of Massachusetts, of 1775, and of that of Georgia of the same year, and of the repeated declarations of such men as Washington, Franklin, Adams, Sherman, and a host of others, I cannot here even enumerate. In fact, almost all the great men who have adorned our history, expressed views of the Christian Sabbath quite the reverse of yours.

Read the order of President Lincoln of November 16, 1862, and you will see what that great man thought of the Christian Sabbath. But I could expand this brief note into a very large volume with similar citations, had I time and space for it. I wish you would go to the Congressional Library and examine a book you will find there, entitled: "Christian Life and Character of the Civil Institutions of the United States," by B. F. Morris. You will discover from its careful perusal how our Christian Sabbath has been regarded by our great and wise men from the beginning.

Very respectfully yours,

BYRON SUNDERLAND.

WASHINGTON, D. C., Dec. 10, 1888.

\* \* \*

DEAR SIR:—Your courteous note and the accompanying pamphlet came to hand this morning (December 10th). Accept my thanks for this addition to the literature of the question.

Allow me to suggest that we do not demand the Sunday Laws on religious grounds, but as a measure of public policy—on the same basis as the laws defining the number of hours of work, etc.

May I also suggest that your view greatly narrows the grander conception of civil liberty. The basis of true freedom is not individualism but the fair application of the law of reciprocity. That large portion of the community, to whom the Christian faith is the very law of life, has *some* rights—rights which would be invaded by the permission of public and private work, which would dis-

qualify the Christian man from conscientiously holding office, and would throw hundreds of thousands of Christian workmen out of employment. A free Sunday would entail more bondage of conscience and more invasion of rights than the most odious blue laws ever enacted. We claim to be the advocates of rational freedom. Being such, we are always glad to hear what any intelligent man has to say against us.

Sincerely Yours,

GEORGE ELLIOTT.

## THE ASSAY OF ABSTRACT IDEAS.

Mr. David Newport's essay, "The Self-Evident," is presented to our readers as an endeavor to dispose of problems which, editorially, have been treated according to another method. We refer especially to the articles "Form and Formal Thought," and the pamphlet "The Idea of God." Our aim has been to free the mind of mysticism as well as of obscurity, which always will beget mysticism. Mr. David Newport speaks of the "infinite power" and "infinite intelligence" as being "self-evident to finite intelligence." We do not doubt that there is some truth in the conception which Mr. Newport calls "infinite power and intelligence." But to us such ideas seem obscure and even contradictory. Infinity and eternity are abstract conceptions invented for special purposes, denoting certain processes that can be carried on without limitation. Space is infinite and time is eternal; every attempt at measuring space or time could be carried on for ever. But how can a power or a cause be infinite? And what the meaning of an infinite intelligence is we cannot say. Infinite power may mean inexhaustible or immeasurable by the means at our disposal. Infinite intelligence may mean an intelligence whose potentialities of progress are unlimited. Whatever is meant, all the conceptions, infinite power, or cause, or intelligence, are extremely complex and far from self-evident.

We highly respect Mr. David Newport for his liberal principles and his firm faith in the possibility of reconciling religion and philosophy. We present his views, but we cannot follow him on his ground. He may be able to make a truce between Religion and Philosophy, but not a peace that will be respected for ever. Science must not give up her claim for the sake of intuitive arguments, which may possess great weight with our emotion, but cannot stand critical investigation.

Our ideas must be analyzed as coins are assayed. We must know the exact value of every one. Our abstract ideas are like bills. They must represent the real value of gold or they are worthless. Let us accept no bill whose authority is mysterious; there is danger in it. An intellectual bankruptcy would necessarily follow. John Law's ingenious scheme of paper credit ruined France more than a century ago. Any method of philosophizing that deals with abstract ideas not representing realities, is philosophical Lawism.

P. G.

## A RHYME OF THOMAS THE DOUBTER.

BY WILLIAM HERBERT.

When the Master had finished the story of the sower and the seed,  
And had shown his disciples the lesson of rock and wayside and weed,

Then up spoke Thomas the Doubter, and his brow was furrowed  
with thought,—  
He had seen a darker problem in the lesson that was taught.

"Master," said Thomas the Doubter, "when the seed sown is the word

I can see the meaning right plainly of the lesson we have heard.

"But, Master, say that the sower were God and the seed were men  
And some of them fell by the wayside, what were the lesson then?

"For I see men daily, my brothers, like the seed of which you spoke,  
And among the thorns fall many, and the thorns spring up and choke.

"And some of them, good master, fall where the soil is scant,  
And they perish there for the absence of the life for which they pant.

"It is easy," said Thomas the Doubter, "for those on good soil  
cast,  
For they have their joy of living and the harvest at the last:

"But those who fall by the wayside, in thorns and on stony ground,  
Are they like the seed-grain scattered by a careless hand around?"

But the Master was silent and mournful, and his brow was furrowed with thought.

And there lay on his soul a burden which Thomas the Doubter had wrought.

## CORRESPONDENCE.

### PROFESSOR COPE ON MARRIAGE CONTRACTS.

To the Editor of THE OPEN COURT:—

Prof. Cope has read between the lines of my few remarks anent his proposed marriage system in a manner which does credit to the activity of his imagination. He says: "There is an evident indication in the language of my critic of a misapprehension, common with a limited class of women, that the support of a family is a sort of holiday amusement for a man, while the bearing and care of children is a burden grievous to be born by women." Prof. Huxley says of the original Hebrew of the Bible, that he who is not a Hebrew scholar "can only stand by and admire the marvelous flexibility of a language which admits of such diverse interpretations," and I shall begin to think that my own inornate style is equally diverse if there be anything in my letter to you which warrants the above accusation. I beg to assure Prof. Cope that I am far from thinking lightly of those duties towards wife and children which are so loyally filled by the great majority of men; and if the thought of a woman forced to face the world unassisted is painful to me it is because I know all the disadvantages under which she labors, and how sadly inadequate is the training which she has received to enable her to cope with such disadvantages.

My intention in my letter to you was not to criticize Prof. Cope's article in extenso, as I could not pretend to do so without going more deeply into the subject. Hence what he is pleased to term my "one-sided view." I think that the gentleman can hardly claim to have, himself, viewed the subject largely, as it effects others besides the contracting parties; he does not appear to have seriously considered the effect on offspring nor that which I have pointed out; i. e., that the breaking up of the home would throw the care of the children on the nearest relations of either father or mother. This would certainly be the case if the children fell to the husband's share.

I accuse Prof. Cope of ignoring the rights of all others save the contracting parties; he accuses me of ignoring all cases of possible matrimonial trouble save one and draws my attention to the case of "the good wife who wishes to be rid of a brutal husband." Our divorce-laws protect a woman from a brute, and make him support her. I have also ignored "the good husband who has nursed a viper in his bosom." Any "viper," worthy of the name, would be pretty likely to give her Goodman excellent reasons for divorcing her. Abandoned by him,—as according to Prof. Cope's rule,—being without support, she would, with that subtlety peculiar to the serpent tribe, proceed to capture some other "goodman." This would be but an exchange of calamity. In the third case which I have overlooked, "two people mutually desire separation." "A la bonne heure." Here Prof. Cope and I issue join. Let them separate, by all means. In the fourth case it is supposed that it is the woman who deserts a "good man." A very supposititious case, in which the good man would have my sympathy.

According to Prof. Cope's own showing, women have most to lose in any separation between husband and wife. He alludes to matrimony as "her leading occupation," and further says, "The woman incapable of a reasonable amount of child-bearing is in the position of a man who is incapable of making a living for a family. If we are but child-producers, matrimony our 'leading occupation,' it is obvious that this divorce 'a mensa et thoro' hits us very hard." "Othello's occupation's gone," indeed. To put the sexes on an equality, you would have to deprive the man of his "leading occupation" also.

M. M. E.

### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXIX.—Continued.

The Princes entered the house together, and Ilse received them with a silent curse.

"This is the gentleman," began the Hereditary Prince, "of whom, Mrs. Werner, I have often spoken to you. As a boy he was always called, by those who knew his character, Master Madcap."

"Your Highness should not have acted so," returned Ilse, sorrowfully; "I am a stranger here, and more exposed to misrepresentation than others." She then turned to the Hereditary Prince. "It is the first time that I have seen your Highness since your recovery."

"I am in danger of being again banished from your presence," replied the Hereditary Prince, "and it has been your wish."

Ilse looked at him surprised.

"You have imparted to my father the purport of a conversation that I once had with you," continued the Hereditary Prince, in a tone of vexation. "You have thus caused my father to determine that I shall be removed from here into the country."

"I would not on any account that your Highness should believe me capable of betraying a confidence. If the harmless words I spoke to your father were contrary to your wishes, I can only say, in excuse, that they proceeded from the warmest interest in your Highness."

\* Translation copyrighted.

The Hereditary Prince bowed silently.

"This terzetto is composed of only dissonances," exclaimed Victor. "We are all three vexed at each other,—I most of all, for my disobliging cousin has exposed me to the danger of entirely losing your favor, without having first had the opportunity of winning it. Yet I beg permission at some future time to introduce myself in a better light than amongst the foliage of the tree."

The Princes took leave. When they were clear of the house, Victor said:

"I would like to get a little straight in this matter of the Professor's wife. I perceive now that it is in no case advisable for me to lay my homage openly at her feet. Do not be angry with me, Benno,—I will spoil no man's game; if you can make use of me, I am at your service."

The Hereditary Prince remained standing, and looked so sorrowfully at his cousin that even he became serious.

"If you would do me a service for which I should thank you as long as I live, help me to procure the departure of those that dwell in that house, from this country as quickly as possible. It will bring them no good fortune to remain near us."

"Say it right out: they will believe you sooner than me."

"What reason shall I give?" asked the Hereditary Prince. "There is only one, and I am the last who should venture to express it."

"The lady looks as if she could take care of herself," said Victor, consolingly. "I am more anxious about you. I see you are in danger of being for once of the same mind as your father. Will you not at least venture to raise objections to his sending you away?"

"By what right?" asked the Hereditary Prince; "he is my father, Victor, and my sovereign. I am the first of his subjects, and it becomes me to be the most obedient. So long as he does not command me to do anything which is against my conscience, I am in duty bound to obey him at once. That is the rule of conduct that I have laid down for myself from my own convictions."

"But let us suppose," rejoined Victor, "that a father wishes to remove his son in order to devise mischief against another, in whom his son takes an interest?"

"I still think that the son must go," replied the Hereditary Prince, "however hard it may be for him; for it does not become him to foster suspicions of his father in his soul."

"More son than Prince!" cried Victor; "and there is an end of it, virtuous Benno. Ah, Bergau, where are you going?"

The Marshall, whom he accosted, replied, hastily. "To the Pavillion, my Prince."

"Have you heard any details," asked Victor, mysteriously, "concerning the scare they have had at the castle of my great-uncle? It was about a woman, or rather an apparition, which, in reality, was a spirit that entered as a spectre, with a great row; it began as a thundering noise and ended like a funeral march; it made the doors shake, and the chandeliers jingle like a peal of bells. Have you heard nothing of it?"

"Nothing. What apparition? When—and how?"

"I do not quite know," replied Victor; "but if you hear anything of it, I beg you to let me know."

This the Marshal promised to do, and hastened away.

The Marshal was blameless in his service; he inspected all the accounts conscientiously, took care to have good wine in the cellar, and discharged the ceremonial details of his office well. Besides this, he was a worthy nobleman, but without any great abilities. He was, therefore, a valuable champion of Court; for he contended, with all the energy of a fanatic, for the venerated customs of his household against the irregular pretensions of foreign guests, and was sometimes made use of by the Sovereign as a battering-ram to assault a wall which another would have gone cautiously round. He now came to Ilse, ill-pleased at heart with the commission which he had been commanded to carry out dexterously. He found the Professor's wife in an unfavorable mood. The boldness of Victor, and the secret reproach conveyed in the words of the Hereditary Prince, had made her discontented with herself, and suspicious of the uncertain position in which she was placed. The Marshal long stirred the bowl from which he had to pour; he turned the conversation to Ilse's home and her father, whom he had once met at a cattle-show.

"It is a fine estate, I hear, and has a very high reputation."

Ilse, taking pleasure in this praise of what was dear to her, entered unsuspiciously into the conversation, and told him of the neighboring farms and their owners.

At last the Marshal began:

"Your father is worthy of every distinction; pardon me, therefore, if I put one question: Has your father ever had the wish to be ennobled?"

"No," replied Ilse, staring at the Marshal with astonishment; "why should he have such a wish?"

"I refrain from all observations upon the favorable effect which such an elevation would have upon the career of your brothers and sisters; that is obvious. One can easily conceive that modesty and pride may hinder a man from seeking these advantages. But I

am convinced that his Highness the Sovereign, even for his own interest, would be glad to confer such a favor; for the position of your father, with respect to my gracious master, would thereby become much more satisfactory."

"It is very satisfactory as it is," said Ilse.

"Considering the personal relations into which you have entered with our Court, I may venture to speak openly to you," continued the Marshal, with more confidence. "It would be very desirable for his princely Highness, and for us all, if, on the occasions of his Highness's accidental presence in your country, he could find a house in which he might receive hospitality."

Ilse interrupted him in great astonishment. "I beg of you, Mr. Von Bergau, to explain yourself more clearly, for I do not understand this matter at all. The Sovereign has already honored our house several times with his presence."

The Marshal shrugged his shoulders. "In cases of necessity, the friendly offer of your father has been accepted, but it has always been for a short time, and that incidentally; for even if your father, in his official position, was not at all unfitted for this honor, yet there was no lady who could do the honors of the house."

"I performed the duties of that position as well as I could."

The Marshal bowed. "There was much discussion as to how the breakfast should be arranged without affronting the ladies of the house, and it was very welcome when your father entirely refrained from requiring the participation of his ladies. Allow me also to add, that a rise in your father's position would be desirable for yourself. For your husband, as a learned man of distinguished merit, is in the position of obtaining, on expressing a wish, a rank and position which would establish him as a member of the Court. And if this proposal should be carried into effect, it would give you, under certain limitations, an entrance there also. It would give the Sovereign and Princess an opportunity of receiving you at the castle, and invitations to great Court balls and concerts would be possible."

Ilse rose. "Enough, my Lord, I understand you. I know what my father will do when you offer him that of which you speak; he will laugh and reject the offer, and will say, if our citizen's home is not good enough for our Sovereign to enter, we must resign the honor. But I cannot reject it with the composure which I expect of my father; and I must tell you, my Lord, that if I had had any idea that I, as a lady, was not entitled to enter this society, I would never have set foot here."

Ilse, with difficulty, controlled the indignation which

worked within her. The Marshal was confounded, and endeavoured to pass it off equivocally; but Ilse could not be dealt with; she continued standing, and so compelled him to depart.

The Professor found his wife in a dark room brooding over what had passed. "Will you have a patent of nobility?" she exclaimed, springing up; "it will be prepared for you at once, and for my father also, in order that we may all have the advantages of becoming fit society for the castle without their feeling it a humiliation. It is unsatisfactory to them only to see us occasionally. I know now why I dine alone, and why the Sovereign would not enter our sitting-room at Bielstein. We must have a new name, that we may obtain the education and the manners which will make us worthy of going to Court. And not only us, but perhaps our children. Can you hear this without coloring with shame at our being here? They feed us like strange beasts, which they have procured out of curiosity and will again cast us out of the pen."

"Why, Ilse!" cried Felix, in astonishment, "you are expending more pathos than is necessary. What do the prejudices of these men signify to us? Has not the Sovereign done everything to make our residence here agreeable, according to what we are accustomed? If the people here are obliged by the customs in which they have been brought up, and by the regulations of their circle, to limit their intercourse with us to certain definite forms, what does that signify? Do we wish to become their confidants, and to live with them as we do with our friends at home? They have not deserved such an unfolding of our souls. When we came here we entered into a simple business relation, and we undertook also the obligation of adapting ourselves to their rules of life."

"And we are free to leave here as soon as these rules no longer please us?"

"Just so," answered the Professor; "as soon as we have sufficient grounds for considering them unbearable. I think that is not the case. They require nothing of us that is degrading: they show us the most assiduous attention: what does it signify if we do not take part in their daily intercourse, which we have no right or reason to desire?"

"Do not let us deceive ourselves," exclaimed Ilse. "If in our city any one was to say to you, you may only look at my shoes, but not raise your eyes to my face; you may only go out with me into the open air, but not come into my house; I can eat with you standing, but not sit down at your table, as my dignity forbids me to do so,—what would you, who live so proudly in your circle, reply to such a fool?"

"I would endeavour to learn the reason of his narrow-mindedness,—perhaps pity him—perhaps turn away from him."

"Then do so here," cried Ilse. "For we are invited guests to whom the people of the house close their doors."

"I repeat to you that we are not guests who are invited to associate with the people here. I have been called upon for work, and I have accepted this call, because I look for such great advantage in it to my branch of learning that I would bear far worse things than the disagreeable customs of the Court. I dare not set at stake these important interests by an opposition to social pretensions which do not please me. It is just because I have no particular respect for these rules that they do not disturb me."

"But it grieves and makes one angry that people, in whose life one takes an interest, cling to such miserably antiquated triflings," said Ilse still bitterly.

"So that is it?" asked Felix. "We are anxious about the souls of the *grandees*? There is something to be said on that point. There is an old curse on every privilege which falls to the lot of most who share in it. This may be the case with court privileges. The life of our princes lies confined within the boundaries of a small circle; the views and prejudices of those around them, whom they are not free to choose, hedge them in from the first day of their life until the last. That they are not stronger and freer arises for the most part from the confined atmosphere in which they are kept by etiquette. It is a misfortune, not only for themselves, but for us, that our princes look upon the society that is not noble with the eyes of a deputy chamberlain or a courtier. This evil one feels painfully when one comes into contact with them. I think, undoubtedly, that the struggle which is going on in different parts of our fatherland will not come to a good conclusion, until the dangers are removed which arise from the effect of the old Court regulations on the training of our princes. But it appears to me they are already broken through in many places, and the time may come when all this nonsense will be the subject of good-humored satire. For this etiquette of Court is, after all, only the remains of a past age, like the constitutions of our guilds, and other ancient customs. So far you are right. But those who indulge in personal irritation, as you do now, expose themselves to the suspicion that they are only angry because they themselves desire entrance into the prohibited circles."

Ilse looked silently down.

"When you and I," continued the Professor, "come accidentally into personal contact with such modes of thinking, there is only one thing that befits us—cool contempt and indifference. We wish, for the sake of our princes, to remove the impediments which limit their intercourse with their people;

but we have no wish or impulse to put ourselves in the place of those who apparently direct the rulers of our country. For, between ourselves, we, who pass our lives in strenuous mental labor, would in general be bad companions for princes. We are deficient in the graceful forms and tact, and the easy complaisance of society. The stronger minds would hurt, by their independence, and the weaker would become contemptible by abject subservience. Freedom of choice is all that we wish for our rulers. One feeling we may preserve without arrogance—all who separate themselves from our circle lose more than we do."

Ilse approached him, and laid her hand in his.

"Therefore, Lady Ilse," continued her husband, cheerfully, "be contented for these few weeks. If it should happen to you in reality to be an invited guest of the Court, then you may enter into negotiations concerning your pretensions; and if in such a case you have to take exceptions, do it with a smile."

"Do you speak so from the calm confidence of your soul," asked Ilse, looking searchingly at her husband, "or because you have it much at heart to remain here?"

"I have my manuscript much at heart," replied the Professor; "for the rest, the loss of peace is a greater deprivation to me than to you. You have from your youth, and especially this last year, taken a warm interest in the inmates of this princely castle. You have at times felt yourself much interested in them, and it is on that account that you are more wounded than needful."

Ilse nodded her head assentingly.

"Bear with it, Ilse," continued her husband, encouragingly; "remember that you are free, and may any day leave it. But it would be more agreeable to me if you did not leave me alone."

"Would that be more agreeable to you?" asked Ilse, softly.

"You little fool!" exclaimed the Professor. "To-day we will give up the theatre, and have our evening reading. I have brought with me what will drive away all vexations."

He brought the lamp to the table, opened a little book, and began:

"It happened, one Whitsuntide, that Nobel, the King of all the Beasts, held a Court," and so on.

Ilse sat with her work in her hand by her husband; the light of the lamp fell on his countenance, which she examined searchingly, in order to read therein whether he still felt towards her as before; till at last the iniquities of the fox brought a smile to her lips, and she took the book from him, and read on quietly and comfortably, as at home.

(To be continued.)

## BOOK REVIEWS.

INFIDEL DEATH-BEDS. By G. W. Foote. London: 1888. Progressive Publishing Co., 28 Stonecutter Street, E. C.

The second edition of this pamphlet contains a description of the last hours of Paul Bert, Charles Darwin, Garibaldi, Auguste Comte, Courtlandt Palmer, and others, in addition to the list of prominent men included in the first edition.

MARCHING THROUGH GEORGIA. Henry C. Work. Boston: Ticknor & Co.

This is one of a group of books done in dainty binding, on enameled paper adorned with numerous illustrations, reprinting some of our national songs, and intended for holiday and similar uses. "Marching Through Georgia" was both written and composed by Mr. Work. It is not among the best, either in words or music, of our patriotic songs, but will always be remembered for its association with perhaps the most brilliantly-successful feat in our late civil war.

C. P. W.

FELIX MENDELSSOHN'S LETTERS. Edited by Felix Moscheles. Boston: Ticknor & Co.

We have here a large and handsome edition, rendered more attractive by thirty illustrations, of the letters of Mendelssohn to Ignaz and Charlotte Moscheles, edited by their son, presumably named for their friend, the composer, Felix Moscheles. The editor explains in his preface that these letters, carefully arranged and indexed by his father, came into his possession in 1870, and that he has abstained this length of time from publishing because he believed such delay would have met the wishes of both writers. The letters deal very freely with the works and reputation of contemporary artists, not in the spirit of a narrow and ungracious criticism, but with the liberty such a form of written intercourse allows. The preface includes some personal recollections of the genial composer, and the book is one that contains much instruction for musicians and lovers of genius.

C. P. W.

WHY I AM AN AGNOSTIC. By Saladin and Joseph Taylor. London: W. Stewart & Co., 41 Farringdon Street, E. C.

The author's standpoint may be summed up in the following quotation: "We may frankly acknowledge that the real essence and origin of things are 'behind the veil,' and not knowable, or even conceivable, by any faculties by which the human mind is endowed in its present state of existence. This is Agnosticism." Mr. Taylor explains, as we think, to almost anybody's satisfaction, why he is not an orthodox Christian, or Jew, or Mohammedan. He explains misconceptions and also refutes the common error that the belief in the unknowability of the absolute is equivalent to absolute science. But he has not even attempted to establish the existence of his absolute existence which lies outside of the province of science. It would greatly interest us should Mr. Taylor in an eventual edition explain this basic idea of agnosticism, the existence of the Unknowable, which he takes for granted. Our position has been stated in the editorial of No. 23, "The Unknowable," and in Nos. 43 and 44 of THE OPEN COURT, "Agnosticism and Religion."

THE STORY OF CREATION. A Plain Account of Evolution. By Edward Clodd. London: 1888. Longmans, Green & Co. A. C. McClurg & Co., Chicago.

An excellent book, popular, and yet written with scientific thoroughness. Mr. Clodd's method of quoting in foot-notes the chief authorities consulted, is most recommendable and should become a universal custom. The book discusses the sun and its planets (Chap. III), the past life-history of the earth (Chap. IV), present life-forms (Chap. V), inorganic and organic evolution (Chaps. VI, VIII), the origin of species (Chap. IX, X), and social evolution. There are only two objections which we have to make.

The introductory chapter lacks in clearness and accuracy. It discusses "the contents of the universe" which is made up of matter and power." There are "two indestructible powers of opposite nature to each other; (a) Force, and (b) Energy. And Energy again may be "potential or kinetic." Under the head of force we find "gravitation," and an example under the head of potential energy is a "stone on a roof," one under kinetic energy, a "stone falling." Are not both instances of gravitation? The other objection from our standpoint is the dogmatic acceptance of Agnosticism, which the author considers "impregnable" in opposition to "the unverifiable assumption of dogmatic theology." There is no contradiction between the two. If really it were hopelessly impossible to know whether a consciousness independent of our body like a shadowy ghost exists or not, why should we not at the same time follow dogmatic theology and believe in it? From a positive standpoint both views, that of agnosticism as well as that of dogmatic theology, are untenable.

Many explanatory illustrations add much to the interest of this valuable book.

## NOTES.

M. Alfred Binet will contribute to THE OPEN COURT of next week an article upon "Experimental Psychology in France."

Prof. Albert H. Gunlogsen in *America* of Jan. 3 remarks upon Mme. Blavatsky's work, "Isis Unveiled." European Sanskrit scholarship finds a competent defender in Prof. Gunlogsen against the attitude of the disciples of theosophy.

We shall publish soon an essay by Dr. M. Wilhelm Meyer, the well-known German astronomer. Dr. Meyer is the editor of the astronomical journal *Himmel und Erde*, which has recently been founded in Berlin.

Dr. Andrew D. White will resume his work for the *Popular Science Monthly*, "New Chapters in the Warfare of Science," in the February number. Dr. White is now in Europe making an exhaustive examination of the libraries there for additional material. The chapter immediately forthcoming will treat of "Demoniac Possession and Insanity."

In the *Ethical Record* for January Prof. Felix Adler discusses "The Influence of Manual Training on Character." "There are influences in manual training," says Prof. Adler, "which are favorable to a virtuous disposition. Squareness in things is not without relation to squareness in action and thinking. A child that has learned to be exact—that is, truthful in his work—will be inclined to be scrupulous and truthful in his speech, in his thought, and in his acts."

The second volume of the French translation of Schopenhauer's main work,—appearing in the *Bibliothèque de Philosophie Contemporaine*, Felix Alcan, Paris,—is in our hands. The work of M. A. Burdeau, the translator, is much superior in point of accuracy to that of any English version of Schopenhauer known to us, while the style is charmingly facile and lucid. The various appendices subsequently added by Schopenhauer to his work, including the *critique* of Kant's philosophy and many essays in criticism constitute the subject-matter of this volume. We recommend it to our readers.

Bishop Potter of New York, in an essay which will appear in the February *Scribner's* on "Competition in Modern Life," discusses the moral aspect of competition. "A strife to excel, nay, if you choose, downright rivalry," the Bishop says, "has a just and rightful place in the plan of any human life." A prize fight is probably the most disgusting spectacle on earth, but it has in it just one moment which very nearly approaches the sublime; and that is when the combatants shake hands with each other and exchange that salutation as old as the classic arena, "may the best man win." It is the equitable thing that the best man should win."

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the Nineteenth Century is faith in the ideal entities as possible in fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.

Evolution and Religion. By John Fiske. Price, 5 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

Evolution in its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourn and Prof. Asa Gray. Price, 5 cents.

Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory 3 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents.

The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents.

The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. James. Price, 10 cents.

How Shall We Keep Sunday? An Answer in four parts: 1. Sunday in the Bible, by Charles K. Whipple. 2. Sunday in Church History, by Minot J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 104 pages. Price, 10 cents.

Is Romanism Real Christianity? By F. W. Newman and Francis E. Abbot. Price, 10 cents.

The Change of Front of the Universe. By Minot J. Savage. Price, 5 cts.

Natural Religion. By James Vila Blake. Price, 5 cents.

The Family Purse. By James Vila Blake. Price, 2 cents.

The Philosophy of a Strike. By N. A. Dunning. Price, 5 cents.

Uplifts of Heart and Will. A series of religious meditations or aspirations. By James H. West. Price, 20 cents.

An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE READER will find in THE OPEN COURT an earnest, and, as we believe, a successful effort to conciliate Religion with Science. The work is done with due reverence for the past and with full confidence in a higher future.

THE OPEN COURT unites the deliberation and prudence of conservatism with the radicalism of undaunted progress. While the merits of the old creeds are fully appreciated, their errors are not overlooked. The ultimate consequences of the most radical thought are accepted, but care is taken to avoid the faults of a one-sided view.

## THE QUINTESSENCE OF RELIGION

is shown to be a truth. It is a scientific truth (a reality) which has been and will remain the basis of ethics. The Quintessence of Religion contains all that is good and true, elevating and comforting in the old religions. Superstitious notions are recognized as mere accidental features of which Religion can be purged without harm to the properly religious spirit.

This idea is

**FEARLESSLY AND WITHOUT RESERVATION OF ANY KIND,**  
presented in its various scientific aspects and in its deep significance to intellectual and emotional life. If fully grasped, it will be found to satisfy the yearnings of the heart as well as the requirements of the intellect.

Facts which seem to bear unfavorably on this solution of the religious problem are not shunned, but openly faced. Criticisms have been welcome, and will always receive due attention. The severest criticism, we trust, will serve only to elucidate the truth of the main idea propounded in *THE OPEN CONCEPT*.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

GEN. M. M. TRUMBULL.

In No. 25 *Gen. Trumbull* has an article on "The Value of Doubt in the Study of History." He shows the tendency of historic writing toward exaggeration and falsehood; and he advises teachers to strengthen the minds of pupils by the exercise of doubt. Much of the history of the late war as written by our famous generals is as fabulous as the legend of *Romulus* and *Remus*. It is written by men interested in their own story, and therefore it comes under the suspicion cast upon it by the ordinary rules of evidence. "This war history," says *Gen. Trumbull*, "is woven out of camp-fire yarns." "Like the feet of Chinese children," he says, "our minds were crippled in infancy, and many of them have been lame ever since. They are not as useful to us as they would have been if strengthened in infancy by the exercise of doubt."

WILLIAM I. POTTER.

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishism is means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

ERNST MACH.

Ernst Mach (Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch) explains in his essay *Transformation and Adaptation in Scientific Thought*, (in Nos. 46 and 48), one of the most characteristic ideas of modern science—an idea that lies, so to speak, in the atmosphere. "Knowledge," he says, "is an expression of organic nature." The law of evolution, which is that of transformation and adaptation, applies to thoughts just as well as to individuals or any living organisms. A conflict between our customary train of thought and new events produces what is called the problem. By a subsequent adaptation of our thought to the enlarged field of observation the problem disappears and through this extension of our sphere of experience the growth of thought is possible. Thus the happiest ideas do not fall from heaven, they spring rather from notions already existing. From this standpoint the narrow conception of egotistic views disappears. "The person" is comparable to an indifferent and symbolical thread on which are strung the real pearls of life—the ideas that make up the changing content of consciousness. Humanity in its entirety is like a polyp plant; the material and organic bonds of union have been severed, but by this freedom of movement, the psychical connection of the whole has been attained in a much higher degree.

MONCURE D. CONWAY, on Agnosticism, in No. 47.

Mr. Moncre D. Conway, in reference to the philosophical exposure of Agnosticism in the editorial article of Nos. 43 and 44 of *THE OPEN COURT*, declares that the Unknowable cannot in the least concern the religious nature. Only weariness of wing can have brought free thinkers to seek rest on this raft. Religion does not follow abstract and vague gods, it follows Jesus, Buddha, Mary, who may be known and loved. On the truth and moral value of these great figures, man can base his life. Mr. Conway concludes with the remark that the ethical side of monism has not as yet been made clear. Nature seems predatory and cruelly impartial between good and evil. Adherents of error survive more comfortably and increase more extensively than the disciples of truth. May it not be more truly said that there is a moral law in man to which nature must conform in order to be elevated and transfigured to a nobler existence? Mr. Conway's critical remark if it were unanswerable from the standpoint of Monism would drive religion and philosophy back into the dualism and supernaturalism of former times. And truly the supernatural, if it is justifiable at all, must be recognized in the moral nature of man, unless man is proven to be a part of nature. The editor's answer to Mr. Conway's criticism, in the same number, expatiates on the Oneness of Man and Nature, thus showing that humanity, culture and civilization are but a higher stage of the natural, and that morality does not stand in contradiction to, but is an outgrowth of and a conforming to the cosmical order of the All.

## EXPERIMENTAL PSYCHOLOGY IN FRANCE.

BY ALFRED BINET.

It is known that of late years, in France, a great scientific movement has come about in favor of experimental psychology. While the professors of our High Schools and Universities are continuing to teach an antiquated science, whose only method is that of introspection, there has arisen on all sides in the philosophical reviews, and even in journals strictly medical, a body of work in which the investigation of mental phenomena is conducted according to the methods of natural science. Incontestably, the forerunner of this activity in psychological inquiry was M. Taine, who published in 1869 an important treatise upon "The Understanding." With remarkable penetration M. Taine foresaw, to a certain extent, the most important results attained in recent years. Thus, the entire chapter upon "Images" may still be consulted with profit.

The real inaugurator of the psychological movement proper, is M. Ribot. The psychologists of France owe much to M. Ribot. Without him, without the Review\* which he founded, without the work and results of foreign† investigation which he has made known in France, many scientists would never have thought of devoting their attention to psychological research. Further, by instituting a chair at the Sorbonne and subsequently, at a quite recent date, at the Collège de France, M. Ribot has helped to give an official consecration, in our country, to the study of experimental psychology. Finally, some few years past, in conjunction with M. Charcot, M. Ribot founded a Society for Physiological Psychology which now counts more than fifty active members. In drawing together men of different professions, in bringing the psychologist into communication with the physiologist, the physician, the alienist, the mathematician, and the linguist, that society has fathered a great number of important productions and substantially contributed to the development of the science of psychology.

The personal work of M. Ribot is contained in four valuable monographs upon the diseases of memory, of will, of personality, and upon the psychology of attention. We are informed, moreover, that the author

has been at work for some time past, upon the phenomena of emotion, and that he will perhaps publish, some day, a monograph upon that attractive theme.

It would be difficult to characterize the work of M. Ribot in few words. We may say, however, that he has constantly endeavored to stand upon the ground-work of facts, entertaining a horror of metaphysics that is perhaps exaggerated. Not a metaphysician, he is neither materialist, nor spiritualist, nor monist—nor anything of the kind. He has little love for great systems, and rightly gives precedence to little facts, accurately observed and minutely described. I believe, with him, that the future of psychology lies not in great theories, but in little facts. Respecting the relations of the physical and the spiritual, he regards the matter as a simple concordance, without further fathoming the problem; he has frequently compared the state of consciousness to a state superadded, which in no shape modifies physiological processes, and which acts like a shadow opposite a body. He affirms, in different places, that an unconscious phenomenon is nothing else than a purely physiological phenomenon. It will be thought, perhaps, that despite the repugnance of M. Ribot to metaphysics, a certain metaphysical character attaches to the ideas just noticed. I believe, in fact, that we know *absolutely nothing* regarding the nature of unconscious phenomena. I shall, perhaps, return to this subject at a future day, and briefly present the experiments of M. Pierre Janet, and my own (not yet published), upon the signification of unconscious phenomena.

The method employed by M. Ribot in his admirable monographs, consists in elucidating the mechanism of the normal state by recourse to mental pathology. M. Ribot is neither a physician, nor an observer; the pathological data which he makes use of, are always second-hand; but with an unusually extensive range of knowledge he unites great discernment in the selection and interpretation of facts. And, besides, he presents his psychological conclusions in language so clear and precise, as to form a happy contrast to the terminology of the classic philosophers.

In his studies in pathological psychology, the point to which he has given especial prominence, is the law of mental dissolution. That law can be regarded as

\* The *Revue Philosophique*.

† The experimental psychology of England—The experimental psychology of Germany.

the key-stone of the structure he has reared. He has very correctly observed, and better than had been done before him, that there are stable states—strongly organized, resistive; and weak states—unstable, artificial, and easily lost. For instance, in memory, the stable states are the simple and common movements of adaptation; the more complex are the delicate movements of professional activity, the special memories; in the will, the stable and resistive are the simple impulses, having their origin in an organic state, as hunger, thirst; the less stable are the complex determinations of volition, in combination with mobile moral elements, such as duty, or remote interest; in the attention, the stable is spontaneous attention, kept alert by an active sensation; the weak is voluntary attention and reflection. Now M. Ribot has shown, that in progressive mental dissolutions, the progression invariably follows the same order; it proceeds from the more stable to the less stable; from the better organized to the less perfectly organized; from the higher to the lower. In substance, this is a great law of general pathology, of which M. Ribot has made a happy application to psychology.

By the side of M. Ribot we shall place M. Charcot, the eminent professor of the Salpêtrière, who by his studies of nervous diseases has taken, of late, a prominent position in psychological science. It is M. Charcot who took the initiative in founding the Society for Physiological Psychology; he is president for life of that society. M. Charcot has written no special treatise upon psychology; moreover, he writes but very little. Aside from a few productions in conjunction with his pupils, the only works which we have from him are the reports of his lectures at the Salpêtrière. In these lectures the psychological method is frequently introduced, whenever the theme demands an explication of the complicated mesh of psychical phenomena. We shall cite, by way of instance, the lectures upon hystero-traumatic paralyses, wherein the eminent professor has firmly established the influence of the *idea* upon motory disturbances; and further mention must be made of the admirable lectures upon aphasy, wherein the psychology of language has been so happily resorted to in explanation of the diseases of that important cerebral function.

A former pupil of M. Charcot, M. Charles Richet, at present professor of physiology in the Faculty of Medicine at Paris, has contributed to the advancement of experimental psychology in France by a considerable number of original works. After 1870, M. Richet was the first investigator to re-inaugurate the study of hypnotism; he was, likewise, the first to see in these studies a field of psychological research, "a method of intellectual and moral vivisection." Among the phenomena of suggestion there are several

that belong to him especially; thus, he was the first to show that the personality of a subject put to sleep may be transformed, and every remembrance of the true personality effaced, by suggestion, from his memory, and a fictitious personality substituted. He has also propounded quite ingenious ideas upon the phenomena of unconsciousness; he has brought out the fact, that in hysterical persons and in a great many individuals reputed normal, there exists a sort of a permanent semi-somnambulism; in other words, there is, in these subjects, an unconscious ego, an unconscious activity, which is constantly on the watch, which contemplates, which gives attention, which reflects, which forms inferences, and lastly which performs acts—all unknown to the conscious ego. Finally, M. Richet has published, during recent years, in the *Revue Philosophique*, of which he is an assiduous associate contributor, a long essay upon "Mental Suggestion," which has attracted considerable notice. His researches tend to the conclusion, which the author regards as probable, that thought is transmitted from one brain to another without the intervention of signs appreciable to our senses. The proof, the author himself confesses, is not complete. M. Richet arrives at a probability merely. The numerous treatises that have been published in France upon this subject, are to be attributed to the impulse given by the article of M. Richet.

Another pupil of M. Charcot, M. Féré, now physician at the Bicêtre, has distinguished himself in recent years by his many researches in experimental psychology, the subjects of which have been principally phenomena of hysteria. In conjunction with me, M. Féré has first entered upon a course of investigations in hypnotism and kindred subjects. Our work together, which still continues, has produced as its main result a book upon "Animal Magnetism," which is treated particularly as a branch of psychology. In this line of ideas, M. Féré has made an especial study of hallucinations, and of systematic anæsthesia and paralysis. The investigations referred to have occasioned a great deal of controversy in the circles known as the School of Nancy. The physicians of Nancy have called in question certain conclusions reached by the School of Salpêtrière; but it must be remarked, that as regards the facts of suggestion all discussions that have arisen have related only to verbal differences.

M. Féré has lately pursued, in ingenious experiments upon hysterical and hyper-excitible subjects, investigations upon the psychology of movements. He has shown that the quantity of movement produced depends upon the nature of the sensations. Every sensory excitation, for instance the sight of a red square, at first induces an augmentation of force—a

dynamogeny—measurable on the dynamometer; then, according as the excitation is prolonged, the force diminishes, and dynamogeny gives way to enfeeblement. Such, in rude outlines, are the experiments in psychomechanics by which M. Féré has established a quantitative relation between sensations and movements.

We are obliged to be brief in the present sketch of French psychologists. In conclusion, therefore, we shall simply note the names of M. Espinas, who has published valuable studies upon animal communities; Bernard Perez, who has given to the world several attractive volumes upon the psychology of infants; Pierre Janet, to whom we owe the highly ingenious investigations into unconscious manifestations of mind; Egger, known through his highly interesting study of internal audition, auto-observation; Beaunis, who has written upon arrested actions, upon hypnotism, upon the muscular sense, etc.

\* \* \*

Accordingly, as may be gathered from the preceding sketch, there is not, in France, a *school* of psychology; there are no masters and disciples; there is not a body of accepted doctrines. We all work upon our own individual score, without being subject to any common word of command; we are dispersed, like skirmishers, upon the field of research. In his inaugural lecture at the Collège de France, M. Ribot correctly stated that the characteristic mark of French psychological research was the production of monographs. We possess, in fact, a certain number of experimental studies upon special subjects. We have no universal work, discussing, even in brief, the entire province of psychology. M. Ribot, in adverting to this want, said that two years would be requisite to prepare a treatise upon French psychology, and that, probably, by reason of the rapid advances being made in our knowledge of this subject, when the treatise were finished, it would no longer be available for current use.

This being the character of French psychology, it would be very difficult to state the opinions upon which any great number of the thinkers of our country have united. How know, for instance, the views of M. Charcot upon Personality, when he has not as yet had occasion to express himself upon that point? All that we can do is to endeavor to bring into relief the main tendencies of French psychological inquiry and to indicate the methods preferentially employed.

With relatively few exceptions, the psychologists of my country have left the investigations of psychophysics to the Germans, and the study of comparative psychology to the English. They have devoted themselves almost exclusively to the study of pathological psychology, that is to say psychology affected by disease. Such, if I do not mistake it, is the foremost feature of our work in psychology. One need only

glance at the titles of the principal original treatises of M. Ribot to note that they treat of pathological conditions: Diseases of Memory, of Will, of Personality, etc. All the other authors have followed his example: they have sought in the pathology of the mind or in the pathology of nervous action, the data to render intelligible the mechanism of the normal state. The marked favor that studies in hypnotism have met with in France, is a further proof of the preponderance acquired by pathological psychology. The results attained by the systematic employment of the pathological and clinical methods, have been extensive; but at the present time they yet remain scattered in a mass of reports accessible only to specialists. Consequently, these results are almost unknown to the psychologists of foreign countries. Thus is explained a circumstance that does not fail to excite surprise. Although it is well established that pathology has furnished psychology with the most recent and the most numerous results, the works upon psychology appearing in Germany, in Italy, in England, and in America, and which pretend to give a complete picture of the present state of psychological research, say almost nothing of the investigations of mental and nervous pathology. The scientific work, really French, is not recognized, and in effect, suppressed.

PARIS, December 22, 1888.

#### SYMPTOMS OF SOCIAL DEGENERACY.

BY MONCURE D. CONWAY.

The word "civilization" is very vaguely used. There is really no such thing as a universal or cosmopolitan civilization. There are civilizations and civilizations. There was an old Brahman civilization, a Persian, an Egyptian, a Greek, a Roman civilization; but the best man in either would be likely to find himself regarded as a barbarian in any of the others. In the present day we witness a civilization in England which easily recognizes the barbarity of duelling in Germany or France, but is blissfully unconscious of the savagery which others see in its brutal massacres of men in the Soudan.

We Americans can easily discover survivals of barbaric institutions in the governments and courts of Europe, but are unconscious of the extent to which certain regions of our own country linger on the lowest rungs of barbarism. It would appear that every nation must develop a civilization of its own, if it is to have any. A civilization cannot be imported. A hundred years ago, our constitutional fathers framed a political scheme which they fondly believed a mere modification of, and improvement on, the English constitution. But experience has proved that there is very little resemblance between the two governments or constitutions. We imported the religions of Eu-

rope, too, or meant to do so, but they are all steadily Americanized. All this may mean that we are forming a valuable American civilization; but meanwhile we have to deal with a mass of passions and instincts formed under distant civilizations, and without the organized restraints with which those civilizations could master the dangerous forces developed under them. Our American civilization is, as it were, building a great continental railway which, at certain points, must needs pass through deserts, where recurring cyclones now and then bury the track for miles, and diminish the advantages of the other parts. The gangrene of corruption in political and municipal administration; the prostitution of the ballot in basest venality; the unblushing theft of foreign literary property: these are signs of the decay of an ethical system along with the theology which took it under fatal protection; and of a perilous interregnum during the minority of the scientific moral order.

There are certain symptoms of our social condition in America which suggest an infancy liable to certain troubles, but likely to outgrow them. Such is the ardor of large numbers of amiable people to fasten on others their private notions of personal conduct which does not concern them otherwise than sentimentally. The fanatic who aims to punish his neighbor for drinking a glass of wine, or for selling it, is really proceeding on the principle of the Inquisition. A man has as much right to punish his neighbor for his belief as for any conduct which does not specifically injure another. He may claim that liquor does injure others; but so said the inquisitor concerning heresy. There is a man now serving out a sentence of over twenty years, in Kansas, for selling spirits. It is conceivable that when the Mormons are exterminated their throne may be occupied by a salvationist theocracy which will punish every man who doesn't go to church. It would not be more uncivilized than some of the puritanical pretensions which animate certain large, and even political, organizations. These, however, are crudities of infancy; they are the measles and mumps of a nascent civilization. There are more malignant diseases of infancy. One may compare to scarlatina, for instance, the Kentucky and Virginia vendettas,—recrudescence of ancient Corsica. It is fundamentally the child's tit-for-tat expressed with shotguns.

But there is another American social disease which marks decay of the very tissues of civilization. As the fast fossilizing remnants of early Spanish settlements in the New World are haunted by a special and fatal disease called "Yellow Jack," so certain regions cursed by the old regime of Slavery are beset by a special anti-social malady euphemistically personified as 'Judge Lynch.' The lynching microbe is more difficult than that of Yellow Fever to master, because the moral suf-

ferers seem as proud of their loathsome condition as some remote peasantries are said to be of their wens. Nor does there appear to be in this country any standard of civilization by which 'Judge Lynch' can measure his own monstrosity. I have before me the *New York Herald* (Dec. 11, 1888) with an editorial in which the sheriff of Birmingham, Ala., is applauded for having defended his prisoner from a mob of lynchers, at cost of several lives. Then the editor expresses his belief that "lynch law" is sometimes justifiable. "If corrupt courts systematically side with rogues and leave honest people without protection; if thieves and murderers, by the connivance of the courts and the law officers, habitually defy justice and prey upon the community—in such a case, of which there have been several in the far West, notably one in the early settlement of Montana, the people have, we believe, a clear right to take justice into their own hands."

The editor of the *N. Y. Herald* is a graduate of Harvard Divinity School, and was sometime minister in the pulpit now filled by Robert Collyer. If such instructions as those just quoted issue from the religious institutions of Boston and New York, what can be expected of backwoods mobs-men? The seed of the fallacy is in the phrase "lynch law,"—euphemism for lawlessness. The writer confuses these blood-thirsty ruffians with the Vigilance Committee which anticipates the establishment of law-courts in new communities. But the Vigilance Committee is a law-court; it hears testimony, weighs evidence, and sometimes acquits. "Judge Lynch" starts out not on an expedition of justice but of murder. He needs no justification more complete than the *Herald's* declaration that he has a right to defy the courts of law, judge, and jury, provided, that they do not decide as he (Lynch) may wish. That, of course, is the only meaning of a mob's right "to take justice into their own hands," which our reverend editor finds so "clear." For in a difference of opinion between Lynch and the lawful jury, as to whether a man is innocent or guilty, there is clearly none to decide save what brute force Lynch may gather on his side.

There are two salient features of "Judge Lynch,"—his barbarism and his cowardice. His barbarism consists in ignorance of the dependence of civilization on recognition of a man's innocence until he is proved guilty; and on all such proof being under all the safeguards of innocence which society has established. The legal tribunal has been constituted for the very exact purpose of securing that dispassionate deliberation of which the lynchers are incapable. The prisoner, until his guilt be so proven, is still a citizen,—his durance, if proven unjust, entitling him to redress. Consequently a citizen under arrest is especially under the protection of the community; his helplessness

is an appeal to the impartiality and consideration of every man who knows the value of his own freedom and security. Until he be proved guilty, every honorable citizen will consider that prisoner as, in a sense, rendered sacred by his trouble and helplessness; and realize that he himself, or those dearest to him, may at some time be falsely accused. Hence the cowardice of "Judge Lynch." He brings the armed many to attack the one unarmed. How brave! How honorable! The hundred lynchers of one unarmed and presumably innocent man are not only, in the law's eye, a hundred murderers, but meaner and more cowardly murderers than their victim can be; for if guilty, he did take some risk—otherwise he would not be a prisoner. Were it understood by such curs that they are likely to meet the resolute resistance of such brave sheriffs as Smith of Birmingham, Ala., there would be little of this savage sport of running down defenseless men like foxes.

Mark Twain in his "Huckleberry Finn"—one of the most powerful American stories—has drawn a truthful picture of a mob cowed by one man confronting them—jeering them—with gun in hand ready for the first that dare approach. It is certain that if it were imposed on a mob of lynchers that they should draw lots for one of their number to meet the prisoner in single combat, pistol to pistol, the whole gang would sneak away. Yet of this meanness they are unconscious; they regard themselves as gallant gentlemen. And no doubt those dastardly "White Caps," in flogging men and women, consider themselves protectors of society instead of what they are—the very rottenness of a decaying society.

If these evil signs of our time, in this western world, be scrutinized, they will be found indications of the lapse and decay of a social order built on beliefs now discredited. The old dogmas legitimated autocracy, priestly despotism, espionage; human laws, interests, liberties, were of too little importance to be studied by men exploring a supernatural universe. The inquisitor, being without place in the republican constitution, must form a petty despotism for himself. He must gather with foul birds of a like feather. That such *are* foul,—grotesque and vulgar successors of great oppressors,—inspires a hope that they will not be able to arrest the evolution of an American civilization. But we may rest assured that if such disintegrating anti-social forces are ever checked, it must be by the development of a moral order very different from that of mediævalism, which is daily decaying around us, and setting free such malarious plagues.

#### SENSATION AND MEMORY.

The primal condition of knowledge is sensation. All knowledge has its root in sensation, and without sensation there could be no knowledge.

Sensation is a process which, under certain circumstances, takes place in living matter when influenced by its surroundings. Take for instance a moner which you may keep on a watch crystal in a drop of water. Expose the moner to light and the light will excite its activity; touch it with a pin, dipped before in acetic acid, it will flee from the offensive object. Throw something in its way on which it can feed and it will seize it. It will be affected differently by different things, but similarly under similar conditions, and will react accordingly.

Sensation is a psychical phenomenon. When a moner is affected by and responds to irritations, it behaves in such a way as to leave no doubt that there is on a small scale and in a very simple condition the self-same power at work which we feel active in our consciousness. Like ourselves, the moner is a sentient being, a creature that is endowed with feeling. 'Psychical,' accordingly, we call all phenomena of sensation from the simplest feeling of pleasure or pain, or indifferent perceptive impressions to the most complex states of conscious thought and purposive will.

Mr. G. J. Romanes considers as the characteristic feature of psychic acts the faculty of choice.\* This may be true. In making a special selection, in giving preference to one kind of food or another, a micro-organism will best show its psychical qualities; but the essential feature of psychic life, it appears, is sensation or the property of feeling which we must suppose to accompany certain movements of a creature and which is most plainly recognized in the way a creature makes a choice. A sieve certainly discriminates also between the coarser and finer particles which are thrown on its wires, but no one will call the selection made in this way a psychical act on the part of the sieve.

It may be objected, that a sieve is a dead body not moving about nor showing self-motion, and the selection made by it is mere mechanical work. The sieve as such does not possess the life of an organism, but its particles, the wood and the wires, will, under certain conditions, exhibit the same self-motion of which all matter is possessed. The molecules of wood, for instance, will embrace the oxygen of a flame as fervidly as a lover rushes into the arms of his mistress. Self-motion is no special and exclusively characteristic feature of psychic life, it is a universal property of matter. On the other hand we should bear in mind that the motions of life-structures are not exempt from the laws of mechanics. Living bodies are mechanisms just as much as machines, the only difference is that they are living machines. In a machine the motion is transmitted from the fire-place and boiler to other parts of the machine. In an organism the smallest particle has a

\* See Alfred Binet, "The Psychic Life of Micro-Organisms," p. 109. Open Court Publishing Co., Chicago, Ill.

M. Binet's work will be published within the present month.

fire-place and boiler of its own from which it derives motor power. All animals and plants are such living machines. The main difference between plants and animals is that the latter develop the phenomena of psychical life which, save in the rudimentary form of mere potentialities, can not be found in the former nor in any other province of nature.

Of the existence of feeling, we have the most intimate and immediate knowledge, for we ourselves are feeling. Feeling is a fact; it is the most indubitable fact of all; and all knowledge rests on it. Psychology accepts this fact as the basic datum of its investigations and must attempt to reduce all more complicated phenomena of psychic life to simple feelings.

Every single feeling appears to us most simple, but this does not exclude that, in fact, it is a very complicated phenomenon.

The question as to the origin of feeling is an unsolved problem still, and we cannot so soon hope for a satisfactory solution. This much, however, can be safely stated, that we must expect the solution of this problem from biological investigations. Feeling does not come into the protoplasma of organisms from transcendent spheres. The conditions of feeling must exist in the inorganic matter of our world, and the appearance of the phenomena of sensation, will be found to depend upon a special form in which the molecules of protoplasma combine and disintegrate.

If the same irritation, in a moner, is repeated, the animalcule will show a greater ability to respond to the occasion. In other words, the moner possesses memory. A previous sensation has predisposed it to react more readily to the second and third irritation and we must ask, How is that possible?

We can observe that the irritation affecting the moner produces certain chemical changes in its substance, and also the motions of the animalcule are in the same way accompanied by such changes in the protoplasma. The process of life, even if the creature is at rest, is an unceasing activity. Oxygen is constantly being absorbed and food assimilated while the waste products are excreted in the form of carbonic acid and in other decompositions. The rebuilding of the life-substance by assimilation takes place in such a way as to preserve the old arrangement of molecules. Even on the skin of the hand a scar remains visible years after the wound is healed, because the form and arrangement once produced is preserved: it is transmitted from the old substance to the new growth of cells developing therefrom. This preservation and transmittance of form is the physiological condition of memory. If certain changes which take place in living substance are accompanied by sensation, the preservation of certain physiological forms, produced by such changes, will preserve the corre-

sponding forms of sensation also. They are registered in the protoplasma similarly as a speech is recorded on the tin-foil of the phonograph. If the physiological forms of sentient matter are called into activity by some stimulus, it will reproduce in a weaker form the corresponding sensation just as the phonograph will reproduce the speech.

Memory, therefore, is the psychological aspect of the preservation of physiological forms in sentient substance and is as such the conditioning factor in the development of knowledge from sensation.

The arrangement of the molecules becomes more and more adapted to the impression of their surroundings. Thus under the constant influence of special irritations, special senses are created. Given ether-waves of light and sensation, and in the long process of evolution an eye will be formed; given air-waves of sound and sensation, and in the long process of evolution an ear will be formed. Thus sensation, with the assistance of memory adapting itself to its conditions, produces the different sense-organs.

The different sense-organs possess their "specific energies," as Johannes Müller calls their inherited memory\* of reacting in a special and always the same way upon irritation. Irritations of the eye produce in the optic nerve sensations of light, and irritations of the ear produce in the auditory nerve sensations of sound, even if there be neither light nor sound, but other causes, as, for instance, electric currents. The percepts of vision are felt as images which we project outside of ourselves to places where, by the experience of touch, we have become accustomed to expect their presence.

A new percept of a thing that has been perceived before, will, under ordinary conditions, be recognized as the same. The new percept producing in the sensory nerves the same form of motion as the old percept of the same thing, finds certain brain-structures predisposed to receive it. Being produced in structures shaped by all the former percepts, it at the same time re-awakens their memories. All living bodies have thus become store-houses of innumerable memories, which are treasured up since organized life began on earth and are transmitted and added to from generation to generation.

The percepts of our senses, being specialized acts of feeling, are the elements of our psychic life. They are the facts (or if you so please the ultimate facts) given by reality; and it is from them that we derive all the knowledge we have. From them all our abstractions grow, our concepts, our formal thought, our ideas, and even our ideals. All the higher intellectual and spiritual life of man's consciousness, the schemes of

\* See OPEN COURT, Nos. 6 and 7: Ewald Hering, "Memory as a General Function of Organized Matter."

the inventor, the fancies of the poet, and the theories of the philosopher, blossom forth from, and can be reduced to, the simple data of perception.

The simple phenomenon of sensation has in the long process of evolution grown highly complex. The nerves of animals being centralized in the brain, their feelings form a multifarious unity which is called consciousness. The unity of consciousness is not (as has been supposed in former centuries) the life-principle, nor is it the soul of the animal, and still less is it a substance existing independent of the body of that creature. On the contrary it is the product of the whole organization. Consciousness is a very complex and unstable state, consisting of many half-conscious and sub-conscious feelings, which in a healthy state of mind are focused in the present object of attention.

The whole organism with its structures and forms, in so far as we consider its psychical side, is called the soul of that organism. Soul, therefore, we define as the psychical aspect of all the organic forms of our body.

Mind is a synonym of soul. However, the word soul is used with special preference when we refer to our emotional life, while mind rather denotes the intellectual activity of the organism. When we speak of spirit, we think of soul-life without having any reference to the bodily forms in which it manifests itself. In the same way we speak of "the spirit of a book" and "the spirit of the age." If "spirit" is supposed to have an independent existence of itself, the word becomes synonymous with "ghost."

We sum up:

Memory is the law of preservation of psychic forms. From simple sensations it has produced sensory perceptions in well-organized sense-organs, and then from the perceptions of the sense-organs the concepts of the mind. In the further progress of evolution we reach the domain of knowledge represented in abstract ideas with all their rich and varied forms of thought, which lead man into the provinces of science, art, religion, and philosophy.

## DREAMS, SLEEP, AND CONSCIOUSNESS.

A PSYCHOLOGICAL STUDY BY GEORGE M. GOULD, M. D.

### 1. PREFATORY.

The design of this paper is to study the nature of consciousness and of its origin, from the facts of sleep and dreams. But since even one's own dreams are vague and elusive, those of another person must be particularly so, and, it therefore seems necessary to depend mainly upon one's own dreams for data. Hence the apparent egotism of the references to follow.

The facts supposed to be known are, some of them, as follows. A sensory, afferent, or centripetal nerve is one that conveys an impulse from an outlying or peripheral point towards the spinal cord and brain. In some ganglionic centre it becomes an efferent, centrifugal, or motor impulse, that is conveyed by the appropriate

nerve to the muscles of the part first stimulated, and this part is accordingly moved or becomes otherwise functional. Stimulus of the nerve leading from the skin, at any point in its course, produces the same motion, and an electrode, thrust into the cortical centre, also produces it. But the action of this centre is also directed by the consciousness or will: we can move the foot without its having been hurt. Consequently, commissural, or associate fibres, must proceed from the motor centre to the organ of consciousness to convey its impulses to this organ, and yet others to convey mandates from consciousness to the motor centre. It is the same with every sense-centre; it must have afferent and efferent fibres uniting it with the higher centre of consciousness. These facts necessitate a localization of the organ of consciousness. Such cases as "The American Crowbar Case," and a thousand observations in vivisection and pathology, show that this organ is located in the frontal lobes of the brain. The theory of sleep and dreams now assumed is, that in sleep, all the subordinate centres of sensation and motion are non-functional, neither influencing the activities of the organ of consciousness nor influenced by it, and that dreaming is the mimic play of the organ of consciousness without the stimulus, the inhibition, or the data—material—habitually furnished by the subordinate centres.

### II. WHAT IS SLEEP?

So long as physiologists have not accurately determined the physiological conditions of sleep, we cannot be dogmatic in our definitions. But whatever else it may be, it is essentially a condition of rest. Our waking life is characterized as a life of action, that is, of the outlay of force. We picture to ourselves the great motor centres of the brain and cord as undoubtedly recouping themselves, even during waking activity, from the great manufactory of force, the digestive and assimilative system; but it is also necessary to suppose that, during waking, we are, as it were, "running down," trenching closer and closer upon both the store in reserve and the power of ready manufacture, so that a time at last arrives when all expenditure must cease and the process of restoration and restoration must have sole sway. Nervous phenomena are plainly phenomena of the discharge, guidance, and distribution of force. Functional activity everywhere exhausts, and necessitates periods of rest, regeneration, and restorage. It is this dynamic aspect of the question that is certain and suggestive. Sleep may be thus partly defined as the cessation of the functional activities of the sensory and motor centres that habitually consist in the reception or the discharge of force. Organs, whether of motion, sensation, or co-ordination, are not now pushed into action by the messages of command from the resting or sleeping centres. I am aware that this does not account for the difference that undoubtedly exists between the rest of sleep and that of waking. There is, of course, some mystery here, though I do not believe it a profound one. When awake, whether resting, or the origin of muscular contractions, a motor centre is probably the source of continuous discharge. All muscles have *tone*, many are required to be persistently innervated, and any or all may instantly require power. But in sleep the function of regeneration of nerve-force predominates over the discharging function. One organ cannot at the same moment perform two totally different acts or functions equally well, and hence one must be paramount. Now, unless discharging, a centre cannot affect either muscles or consciousness. If it do not affect muscles, it rests. If in addition it do not affect consciousness, it sleeps. When, in all motor and sensory centres the regeneration or restorage function predominates over the discharging function, and when, therefore, the organ of consciousness receives from them no discharges, we have the general condition of sleep. Permanent predominant discharging constitutes the waking condition of centres, single or general; permanent predominant regeneration of nerve-force constitutes sleep. In this, as in many other respects,

it is highly interesting to find, as has lately been done,\* that the renal secretion of the sleeping-hours is distinctly stimulant and convulsant, while that of the waking hours is soporific and narcotic. We thus see that by some not-understood method nature eliminates during wakefulness the material of the blood that would, if kept in it, dull the keen edge of action, whilst on the other hand, there is during sleep, strained out of it materials that would spur the centres into wakeful activity. This fact is very suggestive †

### III. WHAT IS CONSCIOUSNESS?

A simple reflex act is one that proceeds from a single stimulus without the implication of other possibly-related centres. The subsidiary centre intermediating the motor response is sufficient to effect the objects of the act. If the act is more than reflex, if more than one centre has to intermediate the complex act, the impulse must proceed from a higher co-ordinating focus that uses the subordinate centres as its media or instruments. The centre of a simple reflex act may be called presentative, that or those of others placed over them, representative. Consciousness may tentatively be considered as the single and highest co-ordinating focus of all the representative centres, or the unique re-representative one. Hither proceed the centripetal lines of stimuli from all points of the periphery. But a moment's consideration shows us it is not only a focus, and one exercising a re-representative function alone. The primary object of all stimulation is reaction; hence, like all its subordinates, it is also, and in fact largely, directional, executive, governmental. In sleep the subordinate or representative centres are not functional, no peripheral stimulus reaches it, and it issues no orders to underlying centres of motion.

### IV. DOES CONSCIOUSNESS SLEEP?

Sometimes we have dreams in sleeping, sometimes we do not. Strict examination of our waking consciousness shows it is not a matter of memory: we do not dream all the time when asleep; we sometimes forget our dreams. Upon waking, we sometimes clearly remember our dreams, at other times our memory is confused; or, again, we are only certain that we have dreamed, but without a trace of what it is we dreamed; and lastly, we are often perfectly sure we had no dreams. Moreover, as all vital functions must have their rhythmical periods of rest, even the heart and lungs being no exception, so the organ of consciousness must sleep. In this fact lies the explanation of what must be considered the pathological character of the consciousness of a vivid and continuous dreamer. An organ of consciousness, if kept by its own hyperæsthesia, or by the fevers and abnormalities of its subordinate centres, or by the unremitting bombardment of multiform sense-stimulation, in a condition of unrest, must exercise an irregular and poor waking control of the body. If the general never slept, his army would soon sleep—the sleep of the vanquished. Forced wakefulness was the most horrible of ancient tortures. The physician well knows that his prognosis often depends upon the effect of his hypnotic.

### V. THE DIFFERENCE BETWEEN THE DREAMING AND THE WAKING CONSCIOUSNESS.

The waking consciousness, as we have seen is the highest unifying centre of the whole organism. It is the focus wherein memories of all past experiences are correlated with all present stimuli or motives, and whence the command is given that is best to subserve the preservation of the organism. The dreaming consciousness, in the first place, is evidently deprived of the great body of

present incitants to action: all stimuli are wanting, all subordinate centres are functionless. What material has it to work upon? From what data must it now proceed? Plainly, those of memory only. But in dreams it is a striking fact that remembered things are not orderly, they do not correspond to reality, but are fantastic and untrustworthy. Why, then, does the waking and sleeping memory differ in such a highly important matter as correspondence with reality? Evidently because in sleep the control of reality is not present; because memory is a function of subordinate centres as well as of consciousness. No more satisfactory conception of memory can be given than that its physical basis consists in a faint reproduction of the same ganglionic discharges that took place in full force at the time of the original sensation or action. If, therefore, the subordinate sensori-motor centres are not discharging toward the consciousness-centre, all that is left in this centre is the *memory of a memory*,—and, in fact, such a designation alone conveys a conception of the unreal and ghost-like nature of the memory of the dreaming consciousness. This centre in dreaming acts weakly and faintly in the same way that it formerly acted strongly when fed by the full forces of its waking subordinates. But in sleeping it remains without the control of reality, which is always logical or obedient to the law of causality; and hence, in so acting, it must be illogical and fantastical.

### VI. ORIGIN AND NATURE OF THE WAKING CONSCIOUSNESS.

The organ of consciousness is single, specialized, and localized. Dreams show us that while the habitual sensori-motor functions and all stimuli are absent, consciousness may be intensely active. Its essential functions are preserved in sleep, and this, were it a cerebrally diffused organ, would be impossible. From old consciousness has been compared to the constriction of an hour-glass through which the sand must pass grain by grain. But one train of ideas can occupy consciousness at one time, and it is always a train, a line, a succession of single stimuli, to which it reacts. This is equivalent to saying that it reacts to the strongest stimulus presented at any one instant. This is its simple form, best illustrated in the consciousness of the dog, where it is always and as it were, mechanically responsive to the presented object. However obedient and engrossed by a duty or demand upon its attention, let there suddenly appear another stimulus,—another dog, a physiological need, etc.,—and previous objects of attention are, as it were, annihilated in the total engrossment of consciousness with the new object. It is the same with almost all animals. Remembrance of past danger in all hunted animals keeps consciousness keenly alert to the signs of danger, so that the appearance, even the thought of such signs, at once floods the organ of consciousness with powerful stimuli, to the exclusion of all others. Indeed, it does not seem absurd to suspect that the escape from danger has been the strongest factor in the development of consciousness. It would certainly emphasize the quality or ability of differentiating self as the object of consciousness, and setting it clearly forth as the chief object of solicitude. An animal rises in the scale of intelligence just in proportion as it is capable of preserving clear memories of past experiences individual or racial, and of fusing these with the present stimulus so that the resultant action shall most successfully secure the preservation of himself and his species. The essence of the matter consists in this fusing process, and the consciousness of man differs in no essential characteristic from that of animals except that, at the instant of fusing, a wider sweep of possible results, a more reflective weighing of more diverse experiences and complex motives, enters into the count. Extension of the weighing time, complexity of the pondered objects, and delicacy of the balancing mechanism—these are but differing degrees of the same powers that belong to both alike.

The suffering struggling consciousness is vehemently endeavoring to arouse subordinate centres,—a condition strangely called "nightmare."

\* *Leçons sur les auto-intoxications dans les maladies.* Par Ch. Bouchard.

† It is also curious to find the popular belief that relatively more births occur in the small hours of the night, is scientifically true—see Dr. Swayne in *Bristol Medical-Chirurgical Journal*, Sept. 1888. One wonders whether the common belief that more deaths occur in these hours is also true.

‡ Unless specified, and especially now, I mean by the dreaming consciousness, the placidly, reflectively, dreaming one,—not that peculiar one in which

The first to be evolved must have been the extension of the weighing time. The mechanical jumping from one presented object to another with unpondering rapidity is naive but primitive. That the serpent in all antiquity has been worshipped as the wisest of animals, may have been because we catch in the restrained glitter of his eye the ability to ponder conflicting motives and stimuli longer than others. Action does not follow stimulus with the celerity of a mechanical force. In the struggle for existence, that animal would rise above his mates, which, other things being equal, could at will prolong the time between the reception of competing stimuli and the resulting action. With this ability would go, *pari passu*, the ability to handle more varied stimuli and motives. Delicacy of equilibration of multiform forces held long in suspense, is only possible to the highest human consciousness, and is its superb characteristic.\* Thus to hold in suspense many competing stimuli, and weigh them accurately, would require a large and complexly organized centre such as the frontal lobes, whose human development has been exactly proportional to the growth of intelligence. After a period of imaginative excitement or creative intellectual work I have a sense of constriction and tension in the frontal lobes, and especially of the right side.†

#### VII. ORIGIN AND NATURE OF THE DREAMING CONSCIOUSNESS.

It is of the very nature of the waking consciousness that it must be always responsive to some stimulus; that it must be equally responsive to either of the many and varied possible stimuli; and, lastly, that it must respond to a stimulus of low intensity, however delicate it may be. It is this delicacy of action that I wish to emphasize. Irritation at extreme or unnecessary noises; æsthetic pain at crude and loud colors; sensitiveness to differences of stimulus of any kind; distinguishes the highly organized personality. There is no bolometer or other instrument of precision delicate enough to measure the inconceivable minuteness of the force that is sufficient to influence consciousness. This quality proves of profound service in sleep. When the animal or man lies down to sleep, I think that, at first, consciousness also sleeps, since to some extent it also must yield obedience to the general law of the rhythm and rest. When sleep is permitted, it is because it is safe to permit it. Hence sleep may at first be dreamless with less danger to the organism. But, since the struggle for existence began, the sleeper has needed a sentinel to stand watch over him, and be on the alert for any one of his thousand enemies. When one thinks of the manifold agencies of harm such as fire, robbers, impure air, malposition of the body, too great heat or cold, physiological needs or pathological conditions, etc., etc., to which the best protected and most civilized people are liable, and how insecurely most of us sleep,—and when we add to all these all the dangers and enemies and perplexities of the savage or the higher animals, we can then vividly realize how necessary such

a sentinel is for the preservation of the organism and the species. That the period of the exhaustion of consciousness is more brief, that its resumption of function would be more speedy, than with other organs, goes without saying, and especially since its function is mainly equilibrational, directional, mirror-like, re-representative,—not creative, remoulding, motor or representative. I am certain that my dreams grow more vivid toward the time of awaking, just as I have no dreams in the first hours of sleep. My own dreams also show plainly the sentry-like function of the dreaming consciousness. I am very sensitive to malposition of the body in sleep. Pressure upon a nerve-trunk is with me extremely prone to produce the phenomenon popularly known as "sleep" of a limb. For this reason I sleep upon a hard bed, and I can sleep in but one position, upon my back without pillow, and without flexion of any limb. If by accident these conditions are broken during sleep, I have as a result a peculiar experience that has happened to me repeatedly and all through my life. My dream at first takes on a tinge of impending danger until I become aware that I must awaken myself. The labor of doing this is both powerful and painful. I am truly conscious of my effort, of a struggle with my dormant members. The energy spent in endeavoring to arouse myself is tremendous. At first I can perhaps move but one finger, then I can bring other fingers into the control of the will, finally the alternate flexions and extensions include the hand, and I may have to wave and thrash the hand and arm for sometime before arousing a sufficient overflow of stimulus to reach other motor centres and spur into the condition of "awake" all the sensory and motor centres of the body. Sometimes the head is the movable part, and this is rotated from side to side with ever increasing extent and quickness, until the general arousing is attained. All this is to me an indication of the sentinel function of consciousness during sleep, of its quick response to slight stimuli, of its directional control of subordinate and representative centres directly intermingling muscular action. It also shows that it is executive only through its agents. Its motor commissural fibers must end in the direct motor centres about the fissure of Rolando. But it also implies that its sensory fibers are, in part, direct, and warrants our belief that the great bundles of centripetal fibers proceeding from the periphery, split and whilst the greater number proceeds to the direct sensori-motor or representative centres about the Rolandic fissure, a limited number proceeds directly to the organ of consciousness. Such an anatomical arrangement would explain the sentry-like function. It would thus become clear why a peripheral stimulus, as a malposition of the body, could arouse the light-sleeping organ of consciousness, which, in turn, could arouse the representative or direct motor Rolandic centres. As will be noticed, the dynamic aspect of the question is always decisive, since the control of subordinate centres is only at first of the smallest, or most easily moved muscles, such as the fingers, a hand, or the head placed in unstable equilibrium. And not only this,—I have often had the sense of weight and discomfort of a limb before I had succeeded in awakening the centre that controlled that limb. The argument for direct sensory fibers to the organ of consciousness is still further strengthened by the frequent phenomenon of my sleep that follows: Upon being aroused by a very sudden noise I have often clearly recognized the fact that I hear the sound with my consciousness, if I may be pardoned the seeming absurdity, before I do with the auditory centre. The vibratory impact arouses consciousness a moment before it arouses audition. The safe-guarding function of consciousness in sleep is thus again exemplified. In "Science," Nov. 2, a correspondent describes an interesting phenomenon of his dream that also throws light upon this aspect of the question. The strokes of a wood-chopper were, in the early part of the dream, irregular and without order. They then became rhythmical for four strokes and then the sleeper awoke to find the clock striking midnight. After awakening he counted four beats and thus he knew that the clock-strokes brought into the

\* Discriminative attention is a human faculty, and appears to be either a selective receptivity of the organ of consciousness, an exclusive reception by it of one kind of stimulus, or the exclusive direction of its innervation upon a single or a special set of subordinate motor centres.

† Still another indication is the fact daily observed by every physician, that eye-strain is a frequent and persistent cause of frontal headaches. It may be worth noting that, like the centre of articulate speech, the organ of consciousness must, by its very nature, be a single organ. Bilateral-symmetry is the law in most other functions of the body and its nervous mechanism. Speaking evolutionally, articulate speech is an accidental afterthought, and so must be located upon one side or the other of the two-sided brain. Upon which side, is not only not invariable, but it is even found to follow—or cause?—the education of the opposite hand for intellectual work. In a recent very interesting case the speech-centre was proved to be localized upon the left side, because, though the man was left-handed for everything else, the one intellectual act of writing was done with the right hand. Arguing from analogy, it might be supposed that the organ of consciousness for right-handed people would be found in the left frontal lobe, since the right hand is the one most generally used for intellectual things as writing, gesturing, etc. There are other considerations that would argue the reverse.

dream their rhythm at about the fifth stroke, and made the axestrokes coincide with the clock-strokes. In other words, the sound and its rhythm reached consciousness directly, impressing upon it their own peculiarities, which persisted for a time until the stronger stimulation of the auditory centre aroused all the mind into "awakenedness." Finally, there is one other curious illustration of the question that also shows the delicacy and the independence or the action of the sleeping consciousness. I allude to the ability possessed by some people of, as it were, winding up the alarm of their mental mechanism so that they shall awake at a given hour. I have known people that sleep soundly and awake habitually within a few minutes of the time they had, upon going to sleep, determined to awake themselves. My own attempts to do this always result in lying awake the most of the night. My alarm goes off at a *sof-p-con*, entirely too soon, and keeps on rattling, at a rate!

Hypnotism, it may parenthetically be remarked, would seem to be the reverse of the dream-state. In the latter there is no centripetal stimulus, the subordinate motor centres being quiescent. In the hypnotic state the senses are alert, the sensori-motor centres actively functional, but the centre of consciousness is asleep, or, what is the same thing, supplanted or enslaved. How this can be done is a mystery. However well attested one is inclined to think it impossible, and that it does not happen, except in the natural way that a pliant weak mind finds satisfaction in acting a rôle, called the hypnotic state.

#### VIII. INSOMNIA.

In passing we may note the influence of the kind of waking life upon the dreaming consciousness. Work, especially physical work, but even normal mental work, is usually followed by refreshing and comparatively dreamless sleep. Worry, solicitude, and vexation, bring troubled dreams and even pronounced insomnia. Why is this? In normal exhaustion of the nervous centres there is no conflict nor unwonted excitation of the centre of consciousness. There is a low reserve, and investment, or action, must cease until interest or income accrues. In long-continued anxiety, however, consciousness is stormed by a multitude of conflicting and continuous stimuli, leading to no definite resolve and action, and hence ending in a surcharge of energies, probably a real hyperæmia and febrile excitation of the organ, that do not cease at night or with sleep. I do not doubt that the frontal lobes of a man dying finally worn out with years of care and disappointment, would, under the microscope, show a different condition from those of a healthy and happy man. On the other hand, if hyperæsthesia is pathological, anaesthesia is certainly indicative of a poor type of consciousness. That must be a vegetative sort of consciousness that sleeps as soundly and as long as the lower centres. No nimble-witted man can fail to be a dreamer. *My* friend must be a dreamer of interesting dreams! One that does not dream is not exceptionally sympathetic, responsive, alert;—he has not highly keen sensibilities, is not nobly religious, or charitable, or aspiring.

I have always been subject to insomnia of the following kind,—I am apt to have periods of paroxysmal, emotional, and imaginative excitement. If I am pursuing an object of study, trying to solve some scientific or practical problem, or if greatly interested in some work of art, etc., I habitually awake in the night after a short sleep, and at once the whole machinery of intellect, imagination, and consciousness is in full cry! The heart is aroused, and by the spur of excitement, is put into the field at full speed. It is clear that this organ of consciousness requires the best of blood, and a deal of it! All this would appear to be the overflow of nerve-force from the centre of consciousness along the centrifugal lines of its habitual discharge to the subordinate centres that are thus kept in a state of activity though really needing rest. All the devices for wooing sleep are but tricks to prevent the outflow. None of the methods commonly employed, help me, and they appear to be based upon a false principle. They generally consist in a repeti-

tion of the same discharges, or an exercise of the same subordinate centres. However often we count or repeat the letters of the alphabet, or in thought, walk up and down the same path, the mimic and weak outflow is by the same commissural fibers to the same subordinate centres. If I am ever able to succeed by any device at all, it is by deflecting, derouting, and subdividing the outflow in such a way that it does not flood any single subordinate centre. No single train or repetition of thought is allowed, the stream is divided so that each subsidiary centre gets such a minimum of excitation that it can resist it, and thus all are calmed. For example, I think for a passing moment, of each part of my body in succession, and of each function of the same, of each sense, with the origin, course, and result of each sensation. Thus traversing the round, I, as I believe, drain off and subdivide the superabundance of innervation to every possible outlet. Instead of persistently *doing* something, or constantly exercising motor centres exclusively, it is better to trust to a mimic sensational exercise. Thoughts of personal motion are outgoing and stimulating, thoughts of visual and auditory sensations are receptive and calming. Another device I have successfully used is to imagine myself in mid-ocean, becalmed, alone, not frightened, and looking out over a monochromatic ocean to all points of the compass successively, thinking of all the strange life in the depths below me whose bottom leads on and on to distant isles,—watching also the starlit space above, as it pales into magical sun-rises, and the ever-changing phantasmagoria of cloudland flows ceaselessly by.

(To be concluded.)

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER XXIX.—Continued.

"How is the Lady Bergau?" asked the Princess, of her attendant, the little Gotlinde Thurn.

"Very ill, your Highness. She has been much disturbed by the sudden departure of her husband, and her confinement is expected every hour."

"Bergau gone away?" asked the Princess, in astonishment.

"The Sovereign has commissioned him to purchase some porcelain curiosities in a distant city."

The Princess looked significantly at her confidant.

"Forgive me, your Highness, if I venture to say," continued the lady-in-waiting, "that we are all indignant. Bergau, it is said, had a scene yesterday with the strange lady at the Pavilion; and this morning early the Sovereign expressed himself, in giving his orders, in a way that made any objection out of the question."

"What has happened at the Pavilion?" asked the Princess.

"That is not known," replied the angry lady; "but, from some expressions of Bergau, one may conclude that the stranger has raised pretensions, demanded an introduction at Court, and threatened to leave in the event of a refusal. The arrogance of the woman is unbearable. We all beg that your Highness will be gracious enough to maintain our rights."

"Good Linda, I am a dangerous ally for you," replied the Princess, sorrowfully.

\* Translation copyrighted.

The birthday of the Princess was kept both by the Court and city. Many people wore gala dresses; numbers pressed with their congratulations into the ante-chamber of the princely daughter. The Princess received in full dress on this day. She appeared for the first time out of mourning, and looked lovelier than ever. In a side room, the door of which was open, stood the tables, which were covered with presents. Much were the splendid dresses which the Sovereign had ordered for his daughter admired by the ladies; and scarcely less so the beautiful miniature work of the Magister by the connoisseurs.

About three o'clock the concert began in the gardens of the castle. Gentlemen and ladies of the nobility, the officials, and citizens, entered the space marked out for them. The numerous attendants of the Princess greeted the ladies of the company and arranged them in a large circle, behind which were the gentlemen, forming a dark setting; on one side the families of the Court, on the other those of the city. The guests accommodated themselves easily to the compulsory mathematical line; it was only on the city side that there was any irregularity. The new city councillor Gottlieb, a distinguished butcher, pushed in from behind his wife and daughter, and placed himself squarely in the front row; and it required the positive directions of the lady-in-waiting to make him retreat to his place.

"I pay the taxes," said Gottlieb, stubbornly, to those about him; but even from his neighbors he was the object of a disapproving smile.

When Ilse entered this society of strangers with her husband, she felt alarm at the cold, inquisitive looks directed at her from all sides. The Chamberlain conducted her to the first lady-in-waiting. The Baroness bowed in cool acknowledgment, and pointed to the place where she was to be stationed—at the end of the Court side, opposite the entrance. The royal party, preceded by the Marshals, made their appearance punctually; the Princess, radiant and smiling, on the arm of the Sovereign; the young Princes behind. The ladies' dresses rustled like a forest of trees, as they bent in deferential salutation; behind them the heads of the assembled gentlemen dropped with solemn movement. The Princess executed a circular bow—a consummate piece of Court *technique*—and proceeded to walk about the line. The sun shone with summer warmth, and all rejoiced in the beautiful day and in the happiness of the child whose birthday was now celebrated. The Princess looked enchantingly lovely, and showed, by her noble appearance and gracious manners, how well fitted she was to do the honors of a Court. The ladies-in-waiting preceded her, beckoning to individuals to come forward, and mentioning the names of those who were

strangers to the Princess. She had a kind word for every one, or a nod and sweet smile, which made all feel that they were the object of her attention. The Sovereign, to-day, appeared among his citizens with the self-possession of a family father.

"A large number of old friends and acquaintances," he remarked, to the head Burgomaster. "I knew that this would be quite after my daughter's own heart. It is the first time since her severe trial that she has had the 'opportunity' to meet again so many that have taken a friendly interest in her life."

But none of the ladies there looked with such eager attention on the circle of the Princess as Ilse. She forgot her anger at the prejudices of class, and the annoyances attendant on her solitary position among these strangers, and looked unceasingly at the young Princess. Like all present, she felt the charm of her gracious manner. This facility of giving pleasure to others in a few minutes by merely a look or word, was quite new to her. She looked back anxiously at Felix, who was watching the graceful movements of the Princess with pleasure. She came near, and Ilse heard her questions and answers to the fortunate ones with whom she was more familiar. Ilse saw that the Princess cast a fleeting glance at her, and that her expression became more serious. The Princess had lingered with a lady who stood in front of Ilse, inquiring with interest after the health of her sick mother; she now passed slowly by Ilse, bowing her head almost imperceptibly, and said, in a low voice, "I hear you intend to leave us."

The unexpected question, and coldness of the tone and look, aroused the pride of the Professor's wife, and, under the flash of her large eyes, the Princess also became more erect, and they exchanged a mutual glance of hostility, as Ilse answered:

"Your Highness will pardon me! I shall remain with my husband."

The Princess looked at the Professor: again a pleasant smile passed over her face, and she continued her progress. Ilse also turned quickly toward her husband, but he was looking about innocently, and, pleased with the world, he had not observed the little scene.

The Sovereign, however, had; for he stepped right across the space to Ilse, and began:

"Among old acquaintances we also greet our new ones. Not that this expression is applicable in your case to me and the Hereditary Prince; for we owe thanks to you for the hospitality of your home; and we rejoice to show you to-day the circle in which we live. I lament that your father is not among us. I cherish the greatest respect for the useful activity of his life; and I know how to value all his services to agriculture. He has obtained a prize at the Agricultural Exhibition; pray convey my congratulations to

him. I hope his example will be followed throughout the country."

The Sovereign well understood how to make up for the neglect of his Court to Ilse. A Professor's wife has many objections to Court usages and high rank; but when well-deserved praise is accorded by princely lips, before a distinguished assembly, to those she loves, it affords her the greatest pleasure. After the annoying question of the daughter, the striking attention of the father was a great satisfaction. Ilse gave the Sovereign a look of deep thankfulness, and he now turned kindly to her Felix, and remained long talking with him. When at last he went on to others, the uncommon consideration he had shown the strangers before the assembled company had the usual result; the gentlemen of the Court now thronged round Ilse and the Professor, to show attention also on their part. Ilse now looked about her with more composure, and observed how slowly the Hereditary Prince passed along the circle, singling out gentlemen and ladies according to a secret systematic rule, and at the same time stopping occasionally and moving his eye-glass, as if he were taking something into consideration. Prince Victor, on the other hand, pursued a thoroughly irregular course, like a comet, whose points could only be determined by looking out for the fairest faces. He had talked long with the daughter of the city councillor, Gottlieb, and had made the young lady laugh so much that she was alarmed at herself, colored, and held her handkerchief before her mouth. He then suddenly approached Ilse.

"A horticultural exhibition like this is exceedingly entertaining," he began, carelessly, as if speaking to an old acquaintance. "Yet, after all, there are many thorny cactuses to be handled."

"It must be very wearisome for the princely party, who have to speak to so many," said Ilse.

"Do not imagine that," replied Victor. "It is pleasant to see so many people before one, who dare not open their mouths unless told to; princely blood will bear still greater fatigues for that enjoyment."

The company were set in motion. The Sovereign offering his arm to the Princess, led her into a great, richly decorated tent. The guests followed, and a host of lackeys offered refreshments. After that the ladies seated themselves behind the royal family; the gentlemen standing round. The concert began with a majestic flourish of the kettledrums; and, after a short time, ended with a furious onslaught of fiddles. The Princess now noticed some of the gentlemen, but with less regularity than the ladies. Ilse was engaged in conversation with Miss von Lossau, but the Princess walked to where Felix Werner was standing and asked eager questions. The Professor became animated, and explained; the Princess asked more, laughed, and

answered. The officious Lord High Steward glanced at the clock. It was high time for the ladies of the Court to dress for dinner, but the Sovereign nodded to him, looked contentedly at the Princess, and, in the best of humor said to his son: "To-day she reigns; we will willingly wait."

"My dear Highness forgets us all, she is so engrossed with the stranger," whispered Miss von Thurn, to Prince Victor.

"Calm your faithful heart, Dame Gotlinde," said Victor. "Our Lady Bradamante has not used her conquering weapons for a whole year. She would try her powers to-day even upon a cabbage-head."

The following morning the Princess sat among her ladies, and they talked, as usual, of the previous day, admired the Princess, condemned a little those who were absent, and expressed astonishment at the toilet and manner of several city ladies.

"But your Highness did not speak to the wife of the City Treasurer," exclaimed Gotlinde Thurn; "the poor woman took it as a slight, and cried after the concert."

"Where was she standing?" asked the Princess.

"Near the stranger," answered Gotlinde.

"Ah, it was on that account," said the Princess. "What is she like?"

"A round little woman, with brown eyes and red cheeks. My brother lodges in her house; that is how I know her. She makes admirable tarts."

"Make up for it to her, Linda," said the Princess; "say something kind to her for me."

"May I tell her that your Highness has heard of her excellent cherry-brandy, and would be glad to have a few bottles of it? That would make her more than happy."

The Princess nodded.

"The daughter of the City Councillor Gottlieb," said the Baroness Hallstein, "has become quite a belle."

"Prince Victor forgot everybody in his attentions to her," exclaimed Miss Lossau, with vexation.

"You may congratulate yourself, dear Betty," replied the Princess, sharply, "if you are forgotten by my cousin. The attentions of the Prince are generally a source of alarm for the ladies who are favored with them."

"But we are all grateful to you," exclaimed Baroness Hallstein, a lady of spirit and character, "for having supported the Court in opposition to the lady from the Pavilion. Your cool remark gave general pleasure."

"Do you think so, Wally?" said the Princess, thoughtfully. "The woman is proud, and was defiant. But I had wounded her first, and on a day when I had the advantage."

(To be continued.)

## NOTES.

Prof. Ernst Mach's work upon Mechanics, *Die Mechanik in ihrer Entwicklung*, etc., has reached its second edition.

M. Binet expects, before long, to present to our readers the results of some experiments upon the nature of unconscious phenomena, not as yet published.

In his lecture before the Chicago Secular Union, Mr. Horace C. Bennett closed with the following remarks:

"To the three eras in one's life, birth, marriage, and death, should be added another, namely, the date of citizenship.

"The grandeur of citizenship and individual sovereignty should be the first, and repeated and re-repeated lesson to every child.

"Every young man should be impressed, as he steps upon the platform of American sovereignty, with the responsibilities and duties imposed, being at once the equal of all, and inferior to none—one of the kings of earth. We want in this country an invincible integrity, a grade of ethics, a sense of honor, and a condition of manhood and womanhood so high and universal, that government, in the sense of past application, will not be needed."

The one hundred and thirtieth anniversary of the birth of Robert Burns will be celebrated on Jan. 25, at the Central Music Hall, Chicago. THE OPEN COURT will soon publish a contribution from Gen. M. M. Trumbull upon the influence of Burns among the working-classes of the Anglo-Saxon peoples. The homely pathos, the broad humor, the exquisite delicacy of the lyric touches of the Scottish poet, have delighted more than the nation of his birth; humanity answers to the sentiment of lines like the following:

Then let us pray that come it may—  
As come it will for a' that—  
That sense and worth, o'er a' the earth,  
May bear the gree, and a' that.  
For a' that, and a' that,  
It's coming yet, for a' that,  
That man to man, the world o'er,  
Shall brothers be for a' that!

In a letter to the *Pail Mall Gazette*, touching a statement from a Chicago paper that he was "disposed to judge Spiritualism more or less favorably," Prof. Huxley writes: "The statement and the suggestion are alike erroneous. \*\*\* The oldest in date of my spiritualistic experiences goes back about five-and-thirty-years. It took place at the house of a relative of mine, and the "medium" was a pleasant, intelligent, well-mannered woman, a native of the United States, whom I will call Mrs. X. The chief performance was the usual pencil and alphabet business, and operations commenced with me as scientific witness and doubter general. The ease and rapidity with which that transatlantic lady fooled me was, as she herself might have said, a caution. The name of the dead friend of whom I was thinking, was spelt out in no time, and I was left morally agape, while Mrs. X. followed up her victory, and made one after another of the company a still easier prey. However, as soon as I could pull myself together, I watched the proceedings somewhat narrowly. I noted that the medium's success was by no means uniform; and in the case of one of my friends, who enjoyed a well deserved reputation for outward impassibility, she failed altogether. \*\*\* Speaking of a conversation at a dinner given by Lord Carlisle, "I learned something else which interested me that evening. One of the guests confided to me that, some time before, he had met Mrs. X. at a country house. In the course of a séance, my informant was told that the spirit of his deceased sister Mary desired to communicate with him, and, with gravity befitting the circumstances, he took his share in the interesting, and indeed touching, conversation which followed. At the end of the séance the company broke up into groups. Mrs. X. and my friend happened to stroll away

from the rest toward a bay window, whereupon this brief but pregnant dialogue took place:—She: Did you ever have a sister Mary? He: No. She: I thought not. Any one could discern, on very short acquaintance, that my friend was a kindhearted, chivalrous gentleman; but it is not everybody who would have perceived so shrewdly that Irish wit had, for once, been too much for Yankee 'cuteness; and that the only chance for the culprit was to throw herself on the mercy of the court." \*\*\*

Prof. Huxley refers to the article of his friend, Mr. Moncreux D. Conway, in THE OPEN COURT of Nov. 8, 1888, and to the confession of the Fox Sisters, and a *propos* of the ingenious methods of mediums generally, remarks: "No one deserves much blame for being deceived in these matters. We are all intellectually handicapped in youth by incessant repetition of the stories about possession and witchcraft in both the Old and the New Testaments. The majority of us are taught nothing which will help us to observe accurately and to interpret observations with due caution. Very few of us have the least conception how much more difficult it is to make such observations and interpretations in a room full of people, stirred by the expectation of the marvelous, than in the calm seclusion of a laboratory or the solitude of a tropical forest. And one who has not tried it, cannot imagine the strain of the mind involved in sitting for an hour or two in a dark room, on the watch for the dodges of a wary "medium." A man may be an excellent naturalist or chemist; and yet make a very poor detective. But, in these investigations, those who know are aware that the qualities of a detective are far more useful than those of the philosopher."

## THE LEADING ORGAN

of British Thought on the American Continent.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,

5 Jordan Street,

Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

TORONTO, ONT.,or J. WALTER THOMPSON, (Times Building),  
NEW YORK

## LUCIFER THE LIGHT BEARER!

Holds to-day the Position of Advance Picket on the Danger Line of the Army of Aggressive and Progressive Journals. For more than two years it has been singled out for prosecution in the Courts by the enemies of Free Speech and Free Press.

Ninth year of Publication. Published weekly at Valley Falls, Kansas at one dollar and twenty-five cents per annum. Send twenty-five cents in stamps for a trial subscription of three months.

## Recent Contributions to 'The Open Court.'

## THE UNIVERSAL FAITH.

By T. B. WAKEMAN.....In No. 71.  
 THE FOUNDER OF THE NINETEENTH CENTURY CLUB.

By MONCURE D. CONWAY.....In No. 71.  
 Two important and interesting articles upon the life, work, and influence of the late Mr. Courtland Palmer, of New York, the liberal and high-minded founder of The Nineteenth Century Club.

## ECONOMIC CONFERENCES.

WHEELBARROW.....In Nos. 73, 40, and 47.  
 The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

DR. PAUL CARUS, EDITOR.

THE READER will find in *THE OPEN COURT* an earnest, and, as we believe, a successful effort to conciliate Religion with Science. The work is done with due reverence for the past and with full confidence in a higher future.

THE OPEN COURT unites the deliberation and prudence of conservatism with the radicalism of undaunted progress. While the merits of the old creeds are fully appreciated, their errors are not overlooked. The ultimate consequences of the most radical thought are accepted, but care is taken to avoid the faults of a one-sided view.

## THE QUINTESSENCE OF RELIGION

is shown to be a truth. It is a scientific truth (a reality) which has been and will remain the basis of ethics. The Quintessence of Religion contains all that is good and true, elevating and comforting in the old religions. Superstitious notions are recognized as mere accidental features of which Religion can be purified without harm to the properly religious spirit.

This idea is,

FEARLESSLY AND WITHOUT RESERVATION OF ANY KIND.

presented in its various scientific aspects and in its deep significance to intellectual and emotional life. If fully grasped, it will be found to satisfy the yearnings of the heart as well as the requirements of the intellect.

Facts which seem to bear unfavorably on this solution of the religious problem are not shunned, but openly faced. Criticisms have been welcome, and will always receive due attention. The severest criticism, we trust, will serve only to elucidate the truth of the main idea propounded in THE OPEN COURT.

#### RATES OF ADVERTISING.

CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

WILLIAM J. PETERK

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishness means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

PROF. E. D. COPE.

In Number 23 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the idealist to deny the existence of matter. The materialist behold the imperfection of the senses may pronounce them to be, one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

WHEELBARROW.

"WHEELBARROW" speaks to the laboring men from the standpoint of a laborer, although he does not work with a shovel and wheelbarrow now. In his first essay, published in one of the early numbers of *THE OPEN COURT*, he says: "I sign my name 'Wheelbarrow' because that is the implement of my handicraft or was when I was a strong man. I was by profession a 'railroad man,' my part in the railroad business was making the road-bed by the aid of a pick, a shovel and a wheelbarrow." We quote this passage because from our personal acquaintance with "Wheelbarrow" we understand that it is literally true.

"Wheelbarrow" treats the labor question in a manner peculiarly his own, with illustrations drawn from every-day experience and presenting a moral which may be seen at a glance. He advises the working men in a friendly, persuasive way, and criticises many of their methods of reform as harmful to themselves, tyrannical and unwise. These essays have been much admired, not only by the working men, but also by men eminent in American literature. In an editorial article on "Wheelbarrow," the *Boston Herald* said: "He possesses in a striking degree the rare ability of being able to treat of complicated matters in so lucid and simple a manner as to make them easy of comprehension to those who have never before given the subject much thought. Last year he published a series of tracts on the labor question which were widely read, but not half so widely as they deserved to be. Treating of his subject from a working man's standpoint, he displayed an extraordinary wealth of apt but homely illustrations."

## THE ETHICS OF ROBERT BURNS.

BY GEN. M. M. TRUMBULL.

One of the chief tests of a great man is this, What was the ethical result of him? What influence did he have on social character and political morality? Let us apply this test to Robert Burns.

A few days ago the birthday of Burns was honored with memorial festivities by all the people of British lineage throughout the world. This poet is greeted on his birthday with a loving homage such as never has been offered to any other poet in this world. The explanation of this pre-eminent popularity is found in the universality of his genius; it embraces all mankind. A marvellous thing, when we remember that no other poet is so intensely national as Burns. He was a Scotchman in every pulsation of his heart. He was himself the intellectual Scotland of the 18th century; equally so as the Scotland of the 16th century was the incarnate conscience of John Knox. Burns is the type and model of the Scottish race in its highest development. No other man has ever stamped his own individuality upon the clay of which his countrymen are made, as Burns has impressed his personality upon all Scotchmen. Their love and veneration for him spring from gratitude and pride. He has elevated the standard of them all. He has added a cubit to the spiritual stature of every man in Scotland, from MacCallum More in his Highland castle to the humblest peasant who tends his sheep upon the mountains.

The chief elements of Burns's popularity are his lyric genius, his ardent patriotism, his manly independence, and his unselfish love toward all the children of men. "In ease, fire, and passion," says Allan Cunningham, "he was second to none but Shakespeare." He might have added that as a lyric poet, as a national song writer, he was not excelled nor equalled by Shakespeare nor by any other poet that was ever born. Burns had the divine gift of music in such excellence that he could put in tune all the different instruments in the great orchestra of man, and force them to vibrate in harmony. There are single songs of his that make the hearts of all men throb in unison together. These songs have passed out of the exclusive ownership of Scotland; they have become the

joint property of all nations in that sublime communism represented

In the parliament of man,  
The federation of the world.

It was said by Emerson that Burns made a mere provincial dialect classic. He did more than that; he glorified by his pathos and humor, not only the dialect of Scotland, but the very weeds in her valleys, the heather on her banks and braes, the hamely fare and hoddan gray of her peasantry, yea, the very rags of her poverty. He made all of them classic as the majestic imagery of Milton. He poured his soul in love and benediction upon his country in such exuberant flood that before the end of the eighteenth century it had overflowed the British Islands, and now covers all the world.

It was patriotism in exquisite refinement that caused this man, when reaping in the harvest field, to turn the sickle aside and spare a thistle because it was the "symbol dear" under which his fathers for a thousand years had fought for Scottish liberty and independence. Only a soul in love with nature manifest in the modesty of beauty could apologize to a mountaineer which the plough struggling for bread had overthrown.

There is deeper feeling still, and a closer kinsman sympathy in the apology which Burns offers to a mouse whose home with all its furniture and stores was wrecked by that same plough in that same struggle for bread. The mouse runs away in spite of the poet's assurance that there is no occasion for fear. He will not even wait to hear the explanation that the ruinous earthquake was an accident, and that the author of it was totally unaware that the mouse's home was in the ploughshare's way. There is nothing so kind and dignified in all the etiquette of courts as the tone and language of this apology:

"I'm very sorry man's dominion  
Has broken nature's social union,  
And justifies that ill opinion,  
That makes thee startle  
At me, thy poor earth-born companion,  
An' fellow mortal."

Only a poetic genius gifted with a knowledge of the divine unity pervading all things, could have made the lofty comparison expressed in the last two lines of that stanza. Only an eye, illuminated by a light brighter than the light of the sun could have seen

the spirit thread that binds even men and mice together in a communion of suffering, toil, pleasure, duty, disappointment, and an impartial mortality. Here, in the words "earth-born companion, an' fellow mortal" we find a key to the social ethics of Robert Burns. We can follow this ethical thread from the mouse to the sheep in "Poor Maillie's Elegy;" from the sheep to the horse in the "New Years Address to the Auld Mare Maggie;" and from the horse to the human brotherhood in "Man was made to mourn."

The ethics of all this tenderness to animals lies chiefly in its reflex power upon the social state; the rebounding of this charity from horses and mice and sheep, upon men and women and children. This poet whose barns were none of the largest, and seldom overloaded, recognized the claims of every "earth-born companion, and fellow mortal" to share with him in the hour of its need. That the mouse was outlawed under the "habitual criminals act," as an incorrigible thief, rather increased than diminished the charity of Burns towards him. In fact, he says,

"I doubt na, whyles but ye may thieve,  
What then, poor beastie; thou man live,  
A daimen icker in a thrave  
's a sma' request;  
I'll get a blessing wi' the lave  
An' never miss't."

Have we any ethical culture of a finer quality than that? Have the churches any more sublime religion than this philosophical socialism of Robert Burns, that he who gives a share of his abundance as justice and benevolence demand will get a blessing with the rest of it? Have they or we any more exalted theology than this of Robert Burns:

"The heart benevolent and kind,  
The most resembles God."

"The merciful man is merciful to his beast," says the scripture, meaning also that kindness to animals is a sign of a morally well-built man, and, let me add, of a brave man. I noticed when in the cavalry that a soldier who was cruel to his horse was generally a coward in battle. In mathematics, the greater includes the less; in ethics the less includes the greater; and in religion too; "As ye have done it unto the least of these my brethren, ye have done it unto me." So the demonstration is complete; the man who is tender, merciful, and just to his fellow mortals of the inferior creation will be considerate, just, and kind to all his fellow men.

The sympathy of Burns was not limited to the universe of mice, or sheep, or men. It went down into the infernal regions, and whispered hope into the ear of the arch fiend, Satan himself; but this hope was conditioned on reform.

"Then fare ye weel, auld Nickie-ben  
Oh wad ye tak a thought an' men't!"

Ye sibblins might, I dinna ken,  
Still hae a stake,  
I'm wae to think upon yon den,  
E'en for your sake."

The sentiment of his "Address to the Deil" may not be theologically orthodox, although, I think, it will be orthodox in time. Our doctors of divinity and our doctors of law have been much confused in their divinity and their law, owing to the erroneous account of the great battle fought in heaven, in the primitive eternity before time was. It is a mistake that Satan lost that battle; and for that mistake John Milton is very much responsible. Satan won it; and that explains the dominion of selfishness, inequality, injustice, avarice, lust, slavery, and gibbets upon this earth. But although Satan won that battle, the war is not at an end. Year by year and day by day the reinforcements of truth, knowledge, wisdom, philosophy, forgiveness, charity, and all the powers of light are coming up to the help of the Lord against the mighty, and the kingdom of Satan will cease to be. I do not say that it will be violently overthrown, for, aided by the poetic and prophetic vision of Robert Burns, I see the coming day when Satan himself will be converted and reformed; when even his principality shall be numbered among the powers that make for righteousness. "Nature's Social Union" broken by "man's dominion," will, by man's intellectual and moral enlightenment be restored.

The necromancy of Burns, the magnetic power by which he subdues the hearts of all men, lies chiefly in his eloquent songs. In these, the poet touches with majestic ease and magic melody every string in the diapason of human passion and emotion, from the martial thunder of "Scots wha hae wi' Wallace bled" to the sweet love whisper in "John Anderson, my Jo," where virtuous old age is glorified, and where the domestic affection of the Scottish people is made famous for evermore.

In his ideal of a social democracy we find the political ethics of Robert Burns. The key to it may be found in that manliest of democratic songs, "A man's a man for a' that." Here "sense and worth" are exalted as the only patents of nobility that can give legitimate rank or titles to any man. In the political morality of this song, the man who is worth the most is the man who has the most worth. It is the proud assertion of a laborer that he is a man for all that, and it is a dignified protest that shall stand forever against the degradation of "honest poverty." The political economy of it is the right of every man that every other man shall work. He must do something by hand or brain useful to the community.

I have heard this song criticized according to the canons of literary taste and style. I have lately read a criticism of it by Matthew Arnold, an eminent man indeed, but one who never came under the spell of its

poetry, because he never belonged to the classes represented in the song. Let him criticize it who has toiled in the field, the factory, or the shop; him who has worked out in the weather, building houses and railroads; him who has earned his honest bread up on the giddy mast, or down in the dark mine. As well criticize the declaration of independence, for its rhetoric. In fact, "A man's a man for a' that" is the American declaration of independence condensed into the poetry of Scotland. The inspiration and the doctrine of both productions is the equality of man. I have seen the declaration of independence very severely criticized not only for its diction but for its politics too. I have seen fifty thousand critics in a line criticizing it with shot and shell and musketry. What of it? When their criticism ended, the flag born of the Declaration, streamed above their speechless cannon, and from every star in its brilliant constellation there shone upon the world the gospel of the political new testament. "All men are created equal;" "A man's a man for a' that."

The personal independence of Burns gives masculine strength and moral vigor to his poetry. It is this personal trait which his countrymen try to imitate. To his immortal honor be it said he founded his independence on his ability to earn his bread by the labor of his hands. In the dedication of his poems to the noble men and gentlemen of the Caledonian Hunt, he is careful to say that this is done only as a tribute of regard, and not as a bid for patronage or favors. In that dedication he uses these words, "I was bred to the plough, and am independent." Here he reverses the former doctrine that independence consisted in the ability to live on the labor of other men. He proclaimed the higher law of independence the ability to live on his own labor. "I was bred to the plough and am independent."

I complain of the amiable injustice which is continually done to the independent spirit of Robert Burns. Loving admirers mourn the hardness of his lot, and reproach his country for neglecting him. "Scotland," they say, "lavish of posthumous honors to her great son, permitted him to live in poverty, and die in debt. He asked for bread and he received a stone." Nothing can be more untrue than that; and they honor not Burns who say it. He never asked for bread; he earned it. Nor did he ever in his lifetime receive a stone at the hands of Scotland. Scotland would not have dared to offer him help either in alms or pensions. He was too proud to accept the patronage of anybody. The brave heart which in life would accept no man's pity, is humiliated with gratuitous pity after death. It is because Burns bore his cross alone, and asked no other man to carry it for him that we honor him to-day. There is no moral majesty in

this world which has not at some time or other worn its crown of thorn. Would Burns be a royal king to-day had he not had the double coronation of poverty and pain? The man who makes the journey of life in a palace-car, who worships from a gilt edged prayer-book, and drinks his eucharistic wine from a golden chalice, presents a dim and dingy appearance at St. Peter's gate, because the soul of him has never been polished by the friction of adversity and struggle. He gets inside, of course, for I believe that every one gets inside, but having no moral mark upon him, no sign of the cross, he mixes with the plebeian multitude and is not recognized in celestial "society."

In like manner the Holy Willies croak harsh judgment against Burns for his indulgence in unworthy appetites. I do not say that Burns was guiltless altogether, but I do say that his vices have been exaggerated, as was necessary, in order to show them in glaring contrast with the moral grandeur of his virtues. For much of this exaggeration the poet is himself responsible. In his moments of remorse, he accuses himself in terms of self-reproach so eloquently keen that many even of his admirers have taken him at his word. In the course of my life, it has been my happiness to number among my intimate friends many members of the Episcopal Church, and I have often been amused to hear them denounce themselves as "miserable sinners," when I knew that their lives were pure, beneficent, and virtuous, that they were not sinners at all, and that there was a house and lot reserved for every one of them in the New Jerusalem. I will not take them at their word, neither will I accept Burns's plea of guilty, extorted from him under the duress of sorrow and remorse.

One day last summer, I stood with a friend gazing on the statue of Schiller in Lincoln park. My friend was one of the Pharisees of art, and he pointed out several defects in the statue. I endured his criticisms very well so long as we looked the great poet squarely in the face, but when the critic took me behind the statue, and showed me that the wrinkle in the back of the coat was not according to the canons of high art, I lost all patience and told him that his criticism had dropped into mere backbiting, and that I must beg pardon of Schiller for listening to censorious remarks about him uttered behind his back. So the Pharisees of poetry stand behind the image of Burns and show us wrinkles in his character. There are people who will not allow you to praise the splendor of the full moon. If you do so they will say that it is well for the moon that only one side of her is visible to man, and that if we could see the other side we might find that her ladyship was no better than she ought to be.

Although much of Burns lived in the earthy fog where inferior mortals dwell, his forehead was always

above the clouds. There, radiant in the sun, it reflected upon earth the melodious poetry of heaven. Near my home is a church, with a tall spire on it crowned with a gilded cross. That cross is the first thing visible to me in the early morning when everything beneath it is wrapped in fog. I can see it gleaming in the sunshine before I can see anything else in the city, several seconds indeed before I can see the sun. There are the church, and the priest, and the congregation enveloped in the fogs of a Gothic superstition, but above them all I see blazing in the sun the symbol of self-sacrifice and in the brightness of it I can read a promise that the mist and the fog shall be dissolved into the ether of eternal truth. So above the clouds I see the forehead of Robert Burns lighted by the forgiving beams of heaven and there I see the golden promise that the mists and fogs which have so long obscured his greatness will all be cleared away.

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XX.

#### HEALTH AND DISEASE. (Continued.)

The Latin proverb regarding the beatitude of a "healthy mind in a healthy body," expresses, in a certain sense, a condition as well as an ideal, since mental disease, and even mental afflictions and disturbances, never fail to react on the health of the physical organism.

The violence of that reaction increases with the preponderance of mental over physical vigor, and consequently is noticed in civilized men more frequently than in savages; but there is no doubt that mental causes of bodily disorders assert themselves even in animals. Grief, for instance, arrests the process of secretion, and thus interferes with the gastric functions, in quadrupeds and birds as evidently as in emotional individuals of our own species. Cows deprived of their calves will often refuse to eat, till actual starvation gradually revives their appetite. A captive lynx, which had been comfortably caged and provided with an abundance of tempting food, annoyed my Swiss landlord by its desperate attempt to break the iron bars of its prison, and for three days and three nights hardly ever ceased its efforts to discover a loophole of escape. But after ascertaining the futility of that hope, the prisoner coiled himself up in his hay-couch and refused to touch another morsel of food, though meat, eggs, and finally a live rabbit, were fastened in a corner of his cage, not more than an inch from his sullenly glaring eyes. He died a week after, without ever leaving his hay-bed, and a *post mortem* examination failed to reveal any trace of external injuries, though his stomach looked as shrivelled as an old

leather purse. Cross bills, and several species of paroquets, can be kept only pairwise and pine away from the hour they have been separated from their mates. Nature seems to revoke the doom of life, whenever the balance of weal and woe preponderates too heavily on the side of sorrow, and stock-breeders well know that solitary and ill-treated animals are specially liable to the contagion of epidemic diseases. The curious phenomenon of suddenly vitiated humors, as a consequence of exasperating mental emotions, explains the envenomed saliva of tortured or enraged animals; and there may be a good deal of truth in the popular theory which ascribes the origin of hydrophobia to be the fury of an intolerably ill-used cur—a poor watch-dog, for instance, that has for weeks been kept chained to a noisome kennel. It is a suggestive fact that *rabies* (*Hunds-wuth*, i. e., "dog-rage," as the Germans call it) is extremely rare in Turkey, where dogs are simply neglected, but almost never chained, and that mad wolves are most frequently seen, not where wolves are most abundant, but where they are most frequently chased and worried by packs of hounds.

Under the influence of irritant mental emotion, nursing animals refuse to suckle their young, either because the secretions of the lacteal glands have been arrested, or because instinct warns the mother that a sudden vitiation of her milk threatens to injure her young.

A similar phenomenon, though rarely accompanied by the same warnings of instinct, has been frequently observed in abnormal mental conditions of human nurses. Dr. A. T. Combe, in his treatise on "The Management of Infancy," mentions the case of a woman whose husband "fell into a quarrel with a soldier billeted in his house, and was set upon by the latter with his drawn sabre. His wife at first trembled from fear and terror, and then suddenly threw herself between the combatants, wrested the sabre from the soldier's hand, broke it into pieces and threw it away. During the tumult, some neighbors came in and separated the men. While in this state of strong excitement the mother took up her child from the cradle, where it lay sleeping, and in the most perfect health, never having had a moment's illness, she gave it the breast, and in so doing sealed its fate. In a few minutes the infant left off sucking, became restless, panted, and sank dead upon its mother's bosom. The physician, who was instantly called in, found the child lying in the cradle, as if asleep, and with its features undisturbed; but all his resources were fruitless. It was irrevocably gone."

That rage can produce an almost instant lethal effect, even upon a most vigorous organism, was strikingly illustrated in the well-attested adventure of Governor Pacheco of California, who, on one of his hunting-ex-

peditions in the foothills of the Sierra Nevada, came upon a big grizzly bear that had taken refuge upon an isolated rock, and by the time of the hunter's arrival, had been completely surrounded by a pack of howling dogs. Seeing the brute's predicament, the hunter galloped back to a valley where he had left a number of herders gathering in their cattle, and with the co-operation of those assistants, soon managed to put two lariats around the waist of the monster, which, at the approach of its new assailants, had risen up, like a man, on its hind legs. Two horsemen laid hold of the end of each lariat, and in spite of his desperate resistance, the bear was pulled down from his vantage-ground, and dragged along, growling and snapping, toward the valley, where Mr. Pacheco intended to chain it up in a barn of his mother's farm. At the gate of that barn a big Spanish wolf-dog rushed out and managed to fetch the grizzly a snap-bite in the rump—a mere flea-bite for a brute of that size, but on turning fiercely to smash his aggressor, the bear found himself checked by the double lariat and in the next moment broke down dead—killed by rage as effectually as by a rifle-ball, or rather by a score of balls, for a pound of lead does not always prove a sufficient dose for a big grizzly. The lariats had caught him around the waist and could not have possibly choked him to death, and only a minute before entering the farm-gate he had demonstrated his vigor by tearing a big piece of bark from a tough old live-oak tree at the roadside.

A curiously analogous case was a few years ago reported from Temesvar in southern Hungary, where a hot-headed young peasant had been arrested on suspicion of complicity in the murder of a landed proprietor. The defendant, however, would have been released for want of positive evidence, if it had not been for the testimony of a witness, who (probably in the hope of earning the offered reward) affirmed under oath that the accused had left his home with a shotgun on the night of the murder. In spite of a pathetic denial, the defendant was then formally indicted, but on being removed from the court-house, came face to face with his accuser, and at once sprang forward with a rush that knocked over the prison-guards, and in the next moment would have had the perjurer by the throat, if his (the defendant's) own brother had not siezed him in the nick of time and flung him back by main force, but withal with an ease which rather surprised him till he found that the silent man in his arms was a corpse.

The English anatomist Hunter was so well aware of his liability to suffer from the effects of mental emotion that he avoided controversies with an extreme, though, as the event proved, not superfluous, caution, and often abruptly left a room for fear of be-

ing betrayed into an angry altercation. "Heart-disease," he used to say, "hangs over my head like a sword suspended by a hair, and every scoundrel has it in his power to cut that hair." In an assembly of his colleagues the doctor's statements were once positively, and rather roughly, contradicted by another physician, and Dr. Hunter at once turned deadly pale and staggered from the room, as if reeling under a heavy blow. The controversy, it seems, had been purely professional, but the doctor was taken sick with fainting fits and a short while after succumbed to the long-dreaded complication.

Terror, and even disappointment, often produce equally fatal effects. History, since the time of Isocrates, abounds with the records of stout men being struck dead by the sudden announcement of dreadful events. During the Russian campaign against the mountain-tribes of the Caucasus, the wife of a captive highlander was carried dead from the tent of General Grabbe, whose clemency she had vainly implored in behalf of her doomed husband; and only a few weeks ago New York papers mentioned the case of a poor emigrant, a South-Italian, who had saved the earnings of years of toil to bring his family to America and who was informed that he must go back under the provisions of the "Pauper Act." When he had realized the full import of the interpreter's communication he sat down as in a stupor, and soon after had to be removed to a hospital, where he died that same night. Such effects of disappointment are not always confined to persons of an emotional disposition. In my Georgia summer-home I was once called to the bedside of a poor mountaineer whom I had for years known as a self-possessed and rather phlegmatic man, but who was suddenly taken sick on learning that his landowners refused to renew his tenure to a little farm which his sons had reclaimed from the wilderness of a mountain-forest. "He complained of a headache about half an hour after Billy came back empty-handed," his wife told me, "and I'm afraid he has *lost his hold on life*, the way he looks and acts." Her husband never spoke again, and died in his sleep a few days after.

There is no doubt that grief shortens life, and that the alleged effect of our modern steeple-chase sort of business habits result from worry, rather than from overwork. Successful work rarely kills. "It is almost miraculous," the German traveler Gerstaecker wrote from California, "what an amount of fatigues a man can undergo with impunity as long as he is braced up by the consciousness of playing a winning game. Two of my tent-mates went to work on a 'gulch'-claim a month ago and finding profits slack, generally came home in the middle of the afternoon growling terribly about the excessive heat and getting fits of the blues

in anticipation of a physical collapse if this sort of bake-oven weather should last much longer. Last week they struck a nugget-stratum, 'panning out' from six to sixteen dollars' worth of coarse grain-gold per hour, and ever since they have been at work eighteen hours a day, singing and joking, digesting the toughest grub with ease, and laughing at hardship, though the heat has since grown worse, so much so, indeed, that some of our less successful neighbors have quit work in despair, and wondering if my partners were born in Hades to stand such weather day after day. And still stranger: the six hours pause are by no means so many hours of rest; on coming home there is cooking to do, and washing and mending, leaving hardly four hours for sleep, half of which is often fooled away with the construction of 'castles in the air.' But at the first glimpse of daylight they are impatiently ready to go at it again, and after a fearful day's work with mattocks and crowbars, I saw little Fritz get up in the middle of the night and swear considerably because the bright streak in the East turned out to be not the dawn, but only a late moon peeping over the ridge of the eastern Sierras."

Fruitless work, on the other hand, saps the mental fountains of energy; and men kept at work by a mere sense of duty or the dogged "never give up," resolution of a strong mind, often break down with a suddenness that is apt to be ascribed to a neglect of hygienic precautions, but which, too often, is the less remediable consequence of a moral collapse under a burden of crushing care.

#### DREAMS, SLEEP, AND CONSCIOUSNESS.

A PSYCHOLOGICAL STUDY BY GEORGE M. GOULD, M. D.

(Concluded.)

##### IX. GENERAL CHARACTERISTICS OF DREAMS.

Most of my dreams are of actions. I do things, or try to do them, or am the object of the acts of others. Very few are contemplative, intellectual, or purely sensational. This shows that the mimic stage of dreamland, in a general way, is the same as that of the waking life. Consciousness is most habitually employed in the direction of the activities of the motor centres.\* Historical man even more than at present has been an active, not a contemplative, reflective, or receptive being. The mimic exercise of motor function by the dreaming consciousness produces for me two types of dreams: first, the clogged, heavy, and impeded, in which the feet are stuck fast or weigh a thousand pounds, etc. I think this is a familiar sort of dream, and finds its *rationale* in the resisted efforts of the organ of consciousness to arouse the subordinate sleeping centres of motion. In the dream we do not know why we cannot lift the feet, or reach the succoring hand; we are only intensely conscious that the foot or hand are sluggish and numb—as in truth they are. Consciousness sends its mandate

\* A dreaming dog presents a suggestive picture:—the paws jerk, the lids quiver, the jaws snap, he barks little short spasmodic barks, or he growls and whines. I picture the consciousness-centre intensely active, the chase in his dream is wild. The subordinate centres are partially aroused by the overflow from the higher centre, but not normally functional until such a pitch of excitement is reached that, in the culmination of the dream, all and several are awakened."

to the Rolandic centres, but there is no response. Hence the genesis of the so-called "nightmare." Resisted and unresponsive effort arouses fear and further effort. Bodily malposition may also serve to beget the endeavor to arouse subordinate motor centres. A co-related fact may be bracketed here. A familiar dream experience consists in dropping or stepping off some high place, or falling through the air, and with the drop, or the crash, we awake in fright. If our conception of cerebral action is correct, this would find its explanation in the loss of the habitual checks and control of the lower sense-centres. When awake, consciousness exercises control of the muscles and saves the body from falling. When asleep, the command is also given, but the lower centres and their muscles do not obey—and we fall. Not only this, but the danger of falling, the predicament we are in, is aroused by the fact that the inhibition and checks of sense-control do not exist in sleep to keep us away from heights and dangerous places. Consciousness records the *efforts* of will we make, as if they were registered in action, and it sees no difference between willed act and motor fact.

The second class of movement, or action-dreams, is the reverse of the first, and consists in movements not only unencumbered, but of transcendent ease. The glorious pleasure of supernatural power and action is indescribable. I often awake quivering with the intense pleasure of free, swift, and confident activity. Sometimes it is a sort of skating or gliding across countless miles of country or ocean; sometimes it is a giant-like striding from mountain-top to top; sometimes the perfect eagle swoop through the blue of space, effortless, and superb! May this be thought of as either a normal play of the organ of consciousness with its own forces, or as a healthy mimic outflow of innervation along the usual routes to the subordinate centres of motion, which, in comparative exhaustion, absorb the inflow without themselves being aroused to an active outflow of innervation?

It has been a source of wonder, that in the classical baschisch dream of the De Quincey type, an eternity of time is compressed into a moment, and, to the rioting consciousness, that moment is indistinguishable from the actual detailed facts of a thousand years. In the same way, space broadens, and the body itself, or the room it dwells in, becomes wide as the starlit night. Personality may even seem to double, and thus again enlarge the boundaries and possibilities of experience. Is not all this also a corollary of the anatomical and physiological conditions of the organ of consciousness? We have memories of waking life only as things and events transpire that memory records: but the evolution of a tree, or a world, or a life, is a *slow* process. But, to the mind, in the condensation of thought, it becomes an instantaneous thing. We can think the evolution of a solar system in the flash of an instant. It is *fact* that draws this out to ages. In sleep, let us again repeat, facts and all their qualities are lost in the loss of the lower centres of sensation and motion. Hence the mental review of time-stretches and the multitudinously-linked chain of facts becomes temporarily as much of a reality to the dreaming consciousness as if the law of causality were truly operative. It does not suspect that its phantasmagoria is not real, because, so far as itself is concerned, it *is* real. We must remember that consciousness is never directly touched by reality. It only receives the echoes and representatives of reality. In the baschisch-dream it is not suspected that the thousand years are not actually passing. It is only when we awake and compare the dream with the slow and droning march of causally-linked things that we recognize that the thousand years were condensed by the wizard of consciousness. Memory is in truth only the memory of psychical happenings, and as these, essentially, are almost, if not absolutely, timeless and spaceless, it follows that the passage of a cycle of material events may be swept through the bour-glass constriction of consciousness in a brief moment. Or again, we may in dreams wish or will to do a thousand things in a flooding instant of boundless desire, that a

world and an eternity could not realize under the conditions of causality. But it is apparent that to the dreaming consciousness this crowded rush of desires and willings is as real, apparently as subject to time and its laws, as if the lower centres were not asleep. It is these lower centres that give to it the term of comparison and enslave it in the treadmill of reality. In sleep the noble slave is temporarily set free: sleep seals the eye-lids of its masters, the spirit rises out of the chains that bind consciousness to reality, and the divine slave at once comes into possession of the universe as its absolute plaything, whilst over its fancy hovers the superb child's hallucination that the paltry nothings of its imagination are real suns and stars and worlds, the actual march of cosmic event and the pomps of eternal time! Its mimic play and lightest wishes instantaneously become incontrovertible and unquestioned facts. Had they reasoned of the world of dreamland, those philosophers that resolved the world, with its laws of time and space and causality, into mentality, would have been wiser than they were.

A pronounced characteristic of all dreams is their great lack of logical correspondence with the laws of the real world. In dreaming this is not recognized. The most intolerable absurdity seems perfectly natural. One face or person fades into another, we take hundred-mile steps, we do things outrageously *mal-à-propos*, without a suspicion of their incongruity. I gather from this that the waking activity of the organ of consciousness is regulated and governed by the multiform stimuli of the subordinate centres. In a certain sense and in the light of evolution, the organ of consciousness is an outgrowth and product of these subordinates. In the waking life their messages must continually be sent to the higher unifying centre. The product of their combined influence must be inhibitory and regulative. In this way there is produced the sanity, the correspondence with reality, that marks the orderly, mirror-like function of our waking consciousness. The essential characteristic of sleep is the non-activity of the subordinates, and hence the unregulated and fantastic mimic life of the organ, acting without data or content. The restraining checks and the completing fullness of the influences of the lower centres, are removed, and hence the inevitable result is inconsequentiality, illogicality. Another reason for this fantasticalness lies in the fact that even in waking the work of consciousness consists in no exclusive occupation with one set of stimuli. Strictly speaking there is no habit of consciousness. It must remain at the instant service of any or many orders and kinds of control, whether of sensation, memory, or various motive. When removed from the inhibition and control of reality, consciousness could not be supposed to show an order and logic of succession it had never had in real life.

Depriving it also of content or *material* would all the more emphasize its whimsicality. In dreams the sense of the incongruous or the ludicrous is with me of the extremest rarity. The humorous is the incongruous, and this is a failure of correspondence with the real. If the comparison with reality be excluded, then, though every dream be incongruity itself, recognition of the fact by the dreaming consciousness is infallibly excluded. I have sometimes been awakened by my own laughter at some apparently highly absurd thing, but when awake I have been just as much disgusted at myself to find the plainly-remembered dream in reality contained no vestige of the humorous.

#### X. DIFFERENCES BETWEEN THE DREAMING AND THE WAKING CONSCIOUSNESS.

I preserve in my dreams most of my stronger æsthetic, deeper moral, and passionate feelings or emotions, but with noteworthy differences. These differences may perhaps be summed up by saying that in dreamland the factitious elements and refinements of a superposed civilization fall away, leaving in relief the nude realism of primitive and disingenuous personality. For example,

the occasional prevalence of generative instincts might alone convert one to the doctrine of biology covered by the adage, *omne vivum ex ovo*. Assuredly, restraint and scruples concerning such matters are not known in dreamland. The chastest do not blush there. I rarely have any care for clothes or nudity there, and the *bizarrie* of my dream-plights in this respect often amuses my waking consciousness. In one way I think it remarkably confirmative of my general thought that, as the savageness of the brute and the selfishness of the animal come out in intoxication, it is not so in dreamland. Rage, destructiveness, tyranny, delight in power—these are almost never present. The reason is that the power-producing, or motor centres are asleep. Neither is hypocrisy known in dreamland. Falsehood is largely a product of civilization. There are few of us that are not forced into subterfuge, peccadillo, and even cowardly lies, by the conventionalities and disguised warfare of civilized life. Consciousness is in truth ethical and unselfish: it holds the balance between the selfish greeds of the lower centres. In sleep these last are forced to stop their wranglings and their competition for place and recognition, and it therefore never occurs to dream-consciousness to lie or deceive for selfish reasons. Morally, dreamland is a brighter country than our noisier world. If dreams tell us anything about our essential personality, they argue against our innate depravity. I think I am more kind and careful of others' rights in dreamland than in awake-land. In the last country I have to endure many grievous burnings of my feelings in the matter of cruelty to animals. In dreamland my indignation at it is constantly aroused. I may see nothing absurd in a fireman compelling his beautiful horse to pull the fire-engine by a three-tined fork thrust through the animal's nose, but I awake, boiling with rage and vowing to arouse society to a recognition of the shame of it all. Unless feelings of profound pity, contempt, indignation, etc., are aroused, I find that in dreamland I am, not immoral, but unmoral. Unless a lie hurts somebody in a way to arouse fervidness of feeling, I do not greatly hate the lie or the liar. But if the lie produce injustice or wrong I hate that, and the author of it, though not because of the falsehood.

In my dreams I have even killed others with utterly no compunction or regret, but with satisfaction that I had righted some wrong, or vindicated somebody, or succored the weak. I remark always the most unquestioned and enthusiastic acceptance of the fundamental passions of pity, love, justice, indignation at wrong, etc. These great forces of mental life have stamped their impress so deeply into the structure of the organ of consciousness that, even when the stimulus of fact is absent, when the subordinate centres are hushed in sleep, and sensation is non-existent, there still remains the play of nervous activity along the old lines, and with sufficient intensity to light up again the emotions that once blazed forth at the touch of the real.

As to the reasoning power, I find my dream-consciousness wholly devoid of it. I have heard of mathematicians working out incomplete problems in their sleep, or the key to some scientific mystery or financial vexation reaching one at that time. To say the least such cases must be very exceptional. Judgment, weighing complex probabilities, induction by close lines of logic from manifold details to a single cause or principle,—all this presupposes a convergence of myriad nerve-currents from many and dissociated points, the focalization of many sensations, memories, past and present, etc., etc. To think is to ponder, and weighing is the essential characteristic of all judgment. But the dreaming consciousness is without judgment. It is always the incongruous with which it deals. Its workshop turns out good work only if good material is furnished it. It is fancy, imagination, feeling, sentiment, but never ratiocination. The subordinate centres that furnish it with material, that give it legality, and hold it to reality, are sleeping. The factory is without "raw material," and the bands go holidaying.

In matters æsthetic my dreamland is a revelation to me, and in this respect alone, frequently transcends reality. I have never taken a dose of *tannabie indica* or other cerebral stimulant. I have no need of such things. Released from the bonds of the actual, my imagination wanders in dreamland among supersensual delights and basks in the light that never was on sea or shore. I note this peculiar fact; in my enjoyment of dreamland-beauty there is an element of fervor, an implication of the feelings, that I can but barely remember, not experience, as I stand before the most beautiful of real things. May the reason of this be, that in addition to the real being always far from perfect, there is in no waking human life utter oblivion of its painful and tragical elements, past or present. Every sense has been outraged, every centre of the brain has suffered, and even whilst these may send their most exultant peans of major joy to the higher centre of consciousness, there must ever intermingle the minor notes and discords of want, dissatisfaction, and pain, that keep its harmony from being perfect. But when all sources of such discords are hushed, when these lower centres are asleep, the freed consciousness can revel in joyousness under the fleeting illusion that its mimic life is real.

#### XI. PREPONDERANCE OF VISUAL SENSATIONS.

Motion and vision are the two great factors of mental life, and it is suggestive to find that those animals, that, so long as possessing motion, keep their eyes and the intelligence that coexists with vision and motility, when they attach themselves permanently to one spot, the eyes and intelligence are lost. Parasites are usually eyeless, and vegetable parasites are without chlorophyll. The whole wretched order of microbes, moulds, and fungi, the curse of the physician and of the world, are parasitical, and without chlorophyll. The insane, the idiotic, the weak-minded, the epileptic, have, relatively speaking, very subnormal vision, and a defective ocular mechanism.

Above the motor element, the predominant characteristic of my dreams is that they are made up of things seen. I do not remember ever to have dreamed of an odor, pleasant or foul, though often dreaming of perfumed or malodorous things. In the same way, though I have dreamed of eating, I preserved no remembrance of impressions of taste. The apple I ate—I cannot now tell if it were sweet or sour. Tactile sensation is somewhat frequently a component of dream-phenomena, but generally only in conjunction with another sensation or feeling that smoothes it. If I am struck by another, the feeling or pain, if existent, is at once lost in some psychical emotion, of anger, or fear, etc. Pain cannot enter dreamland because the centres that feel pain are asleep. I never remember to have remarked in dreams that a thing was exceptionally and peculiarly smooth, or hard, or sticky, etc. I shrink less from touching a foul thing in dreams than in real life. I cannot remember ever to have been cold or oppressively warm in dreamland. If I shiver from cold or am too near a fire I note especially the motion, or sight, or perhaps the feeling of the shivering instead of the cold, and I remember the danger, or the vision of the fire, not the pain. All of this is consonant with the re-representative function of consciousness. The senses are represented in it only when awake. As to hearing, few or none of my dreams contain any distinct records of sounds. I can express it no better than to say that the results of hearing are manifest but not the sounds themselves. I speak and am spoken to, and act accordingly, but I am never able to recall any *timbre* of voice, any inflection, emphasis, or pitch that causes the voice to be, at the time, thought of as remarkable, or that gave its noteworthy, if it had any, enough vividness to project it across the bridge of awaking into a work-day memory. When awake, nothing so fires me with uncontrollable emotion as the music of Beethoven, Wagner, or Franz. I cannot remember ever to have heard music in dreamland.

But how different it is with the sense of vision! Everything

not motion—and that is largely so—is a thing seen. How empty and destitute must be the dreamland of the congenitally-blind! To me vision gives dreamland all its beauty and most of its interest. It could hardly be otherwise, since the same is true of the waking consciousness. Intellect, indeed, is almost entirely formed of visual factors: every component of what we call psychic life and civilization is largely the product of vision. Language and the letters of the alphabet themselves are the records of things seen. Vision is at once the most metaphysical of real, and the most real of metaphysical things. Astride a ray of light Puck passes in a flash from matter to mind. The library of the soul, memory, is a picture-gallery. An absolute monochromatic world would force the spirit to suicide. Had all eyes been absolutely color-blind Psyche would not have been born. It is the associate fibres from and to the visual centre that binds together the world of mind and the world of matter, and that loans life its value, and crowns it with its one unalloyed delight. We sleep at night when the eyes, the great awakeners, ministers, and producers of intellect and life, are least utilizable. Few people, and only those of stolid and blunted sensibilities can sleep in the light, even with what darkness closed lids give. It is interesting to see how all living forms, both animal and vegetable, dwindle to wretched caricatures of life, when, eyeless and colorless, they keep up existence in caves and in the sea-depths.\*

#### XII. CHARACTER, THE SOUL, AND CONSCIOUSNESS.

In a superb story of Gautier, a lover by his power of magic is able to lull into a death-like trance the being of his successful rival. This lover then steals the body of the young husband, his rival, and, leaving his own soul in the entranced body to care for it, the passionate lover plans to trick the faithful wife. The conception is a proof of genius! Think of it! The lover stole a body that thereby he might steal a love, that, in the absence of his own body, was of course not carnal. On the part of the husband one meets a multitude of questions, principal of which would perhaps be, How far would he have been cheated had the thief been successful? On the part of the lady strange trials and mystic queries also arise. Remember that if only her husband's soul were absent, there were present every trick of motion, play of expression, *timbre* of voice, nay, every habit of mind and body that is in any way controlled by the laws of corporeal and nervous organization, or by heredity. What *would* be different? Both lovers would be equally kind, lovable, and loving. Both would express their inner feeling by the same acts and by the same mechanism. Some one said that the Yankee worked badly where soul and body touched. Would you suppose the thieving lover's soul could not avoid an awkwardness in handling the mental centres, and through them, the body, he had stolen? I bring the idea forward here to illustrate firstly, how far "character" is a matter of flesh and nervous organization; and, secondly, how little there is in the so-called "soul" but an impersonal force. If two of your best friends could change "souls," would you ever find it out? I confess that after a rigid exclusion of the elements of character that necessarily inhere in the action of the body and of all subordinate motor and sensory centres, I find, if anything be left, it is a very impalpable and impersonal somewhat. Now this is precisely what sleep does. If, therefore, the dreaming consciousness could have its photograph taken, it would have no recognizable or distinguishing trait of expression. We should never know our disembodied friends. Dream-personality has no individuality. And thus, through physiological psychology, we catch a glimpse of the profound truth that, at heart, we are all the same. One common unity lives in us all, and our jealousies, bickerings, differences, and hates, are but the expression of the accidents of body; our love and kindness, the expression of the one

\* See, Packard, "On Certain Factors of Evolution," *the American Naturalist*, Sept. 1888.

life that feeds all our lives. Dream-philosophy teaches religion and sympathy. There is nothing more noble, or more philosophically demanded of us all than, to one another, simple kindness. It is at once the most human and the most divine thing in this sorry world.

It is evident that a cluster of nerve-cells in the cortex of the brain whose function it is to receive stimuli and answer the same with messages, *e. g.*, to a muscle to contract,—it is clear, that such a mechanically acting centre is not the "soul," or even a part of it. A paralyzed man is just so much a man spiritually and mentally as before the atheromatous blood-vessel drowned the Rolandic convolution. Paralyze every bodily muscle and the fact remains essentially the same. But it is not so with the frontal lobes of the brain. Render them functionless by trauma, disease, or the hypnotic enslaver,—and consciousness, mind, soul, give no evidences of existence. Slice off the frontal portions of the brain of the poor pigeon, and life, power, habit continue, but not what it had of mind. We may be thankful that to the vivisectionist it is impossible and useless to slice from behind forwards and leave only the living organ of consciousness. (With the present "scientific" *Zeitgeist* there would be more disembodied rabbit, guinea-pig, pigeon, and even human criminal souls, wandering about, seeking re-incarnation, than Hindoo mystic ever dreamed of!)—But this is almost exactly what sleep does,—harmlessly, and lovingly, however, and it is of the greatest interest to see what a world is left after all peripheral stimulation and subordinate centres are stilled into temporary death by its kind hand. Dreams show us how great is the world, how shadowy a thing is the essential *ego*. The soul, deprived of the body, seems quite as unreal and phantom-like as any of Charon's passengers. It is so profoundly dependent upon the crude senses and experience, upon memory and motion to give it regulation, order, and reality. As, one after another, sleep strips us of these things, that at best, are but supplies of soul—so paler and ever thinner, ever less individual, grows the *ego*. Picture-making in its last analysis is not strictly psychical, and yet a visionless world would be absolutely a soulless world. Dream-consciousness is consciousness without adventitious aids, physical props, content, and checks,—it is consciousness, *per se*, it is, in truth, a fluttering memory of a memory of past experiences; its life a mimic play; its phantasmal existence is upborne upon the ghostly wings of past sorrows and joys, and tied to reality by the tenuous thread of a momentarily interrupted sensation. Its master, the body, suddenly tugs at the silken cord, and from freedom it swiftly descends and slips into the yoke of reality, attentive to the thousand demands of its imperious and all-precious sovereign!

## CORRESPONDENCE.

### THE PHILOSOPHICAL CLUB OF MONTREAL.

"YOUR NOTHING IS MY ALL,"—*Frank*.

(Addressed to a Small Circle who love Wisdom for its own Sake.)

"Observe those dreamers!" Thus I heard one say.

"Philosophers, and artists, poets—all:

Spurn we their vague 'abstractions'! I would call

Them 'nothings,' read by light of sober day.

The heroes of the world are valiant men,

Doers, who hold the plow or wield the sword,

Or wear the crown as master, king, or lord."

I, sighing mournfully, replied: "O, when

Shall the 'realities' be understood?

Are not the instruments of use or pain

First fashioned in deep contemplative mood

Within the thinker's ever-active brain?

Prosper the dreamer for the nation's weal;

Before him shall the coming ages kneel."

Dear Friends of Philosophy:—

You have expressed a wish to know something of the "small circle who love wisdom for its own sake," to whom the above son-

net, which appeared in the *Toronto Week*, is addressed. The club originated in this wise:

One afternoon when the crimson flow of the setting sun threw a halo across the waters of the St. Lawrence river, and the wind was asleep so that not a leaf stirred, and the very air seemed filled with a quiet pensiveness as if mother Nature herself were dreaming,—three friends met. For the sake of convenience let us call them Progress, Mystic, and Metaphor. I have said that these three were "friends"; by which you will understand that they did not feel it necessary to "make conversation," nor even to talk at all unless when the spirit moved them so to do. For some time nothing was said. Progress broke the silence, saying:

"How I should like to paint this scene!" Metaphor immediately looked up with a startled air, as if the thread of some sweet reverie had been suddenly tugged by something or somebody, and replied:

"I was just wondering what it all means—what everything means! How are we here, why are we at all, where are we going? I cannot help thinking about these things;—is it useless? If there were some great, humble minds—wise, sincere, fearless—made to do their thinking aloud—I could sit and listen—always. I have heard something about a Concord School. Supposing we all go and find out what the philosophers are teaching there?"

"Supposing, instead," exclaimed Mystic, with impulsive, decisive tone, "that we start a society here!"

"It is surely a sadly solemn thing," went on Metaphor, meditatively, "that the true interests of life—its deep problems—are rarely discussed—ignored, one might say—by what is called 'society.'"

"True," rejoined Progress, "one who takes life seriously, and talks on 'deep subjects' is in these days called a 'crank.'"

"Let us start a philosophical club," reiterated Mystic, with increased emphasis. "Let us begin at once! We can meet at each other's houses. And let us invite such of our acquaintances as might be interested in studying with us. I suggest names, one, two, three, four, five, a dozen or so."

The dozen or so were invited, but all declined with thanks. Some had "no time," others "no talent for that sort of thing, you know," others preferred "a useful practical study."

So Progress, Mystic, and Metaphor were thrown back upon themselves,—happily, with spirits undaunted.

"What book shall we take up first?" inquired Mystic. "Were we to make a thorough study of Kant alone, this winter (1887), we might next winter compare him with philosophers of our own time."

"I am anxious to study Kant," said Metaphor; "certain beautiful sayings of his often come to me—simple, yet sublime truths, with a fine touch of poetry about them—quite different from the involved sentences and prosy reasoning of his ordinary style."

"For example?" queried Mystic. "'The starry sky above me, and the moral law within me,—are two things which fill my soul with ever-increasing reverence,'" answered Metaphor. "And here is another. 'Once I held a swallow in my hand, and gazed into its eyes; and it was as if I saw into heaven.'"

After that the three friends met weekly and read and discussed Kant. Take a look at the trio at their first meeting! A bright parlor, a cheery fire, a table on which stands a vase or two filled with roses; a few photographs of celebrated authors, meet the glance, and there are several books for reference. At one side of the table sits Progress, at another Mystic, at a third Metaphor, the fourth has a representation only in a large dictionary.

But after a few weeks the club boasts of a new member. Him we shall name Commentator. Whenever anyone remembered having read something somewhere, Commentator could always lay his finger on the place. The new member proved to be a

most useful one. Kant occupied us all that winter. Edward Caird's work, and Watson's 'Kant and his English Critics' were of great service to us at this time.

In 1888, we took as a text-book, James Sully's Psychology. This work was read aloud, each member taking his turn. Special points were discussed. After reading a section of the text-book, a portion of the evening (meetings are from eight till ten) was devoted to Fichte, Schelling, or other philosopher following Kant.

The last reunion of 1888 was held in the afternoon, in a garden a short distance from the city. The seats were placed under a cluster of trees. The front view was of the mighty St. Lawrence—the broad expanse of whose waters is of itself enough to lead the mind away into the boundless realm of Philosophy. For a moment, here, imagination went to the *Academia* of Plato.

Schwegler's History of Philosophy is our handbook this winter. The first meeting was held on Monday, November 5, when a glance was taken at the period previous to Plato. Next, Plato was discussed; and then the Phædo—in connection with which selections were read from Wordsworth and Addison, etc. In January we opened with Aristotle—the master of those who know—according to Dante; and our evening this week was devoted to the Ethics.

Changes have taken place in our club. Progress is abroad, but keeps pace with our studies. An able student in Edinburgh (a near relative of the late Dr. Andrew Thompson) has signified a desire to become our "Scottish Correspondent." Several new members have been in a regular attendance, showing that there is a steadily increasing interest in the society.

I would say to the solitary worker therefore, Be encouraged by our experience. Look round among your acquaintances, and be not dismayed if you have but a trio or a quartette to start with. If you be not always a learner, you may sometimes be a teacher. Be assured that there is a helpful stimulus in working along with others,—a chance to get the angles rubbed off, and the sympathies broadened. *Tecum habita, et noris quam sit tibi curia supellex.* Our prospective Scottish correspondent writes to ask the questions:—

1. What are the rules of your Club?
2. What is the fee to become a member?
3. Who is the president?

The following is the reply:—

1. There is no rule.
2. There is no fee.
3. As to the presiding officer,—Where the MacGregor sits, there is the head of the table!

MONTREAL, Jan. 1889.

MARY MORGAN (*Gowan Len*).

### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXX.

VEXATIONS.

The year began well in every respect. Woodcock and snipe had betaken themselves to their homes before the sportsmen had donned their boots, and the March-daffodils had really bloomed in March. The moon, between its first and last quarter, smiled every evening with wry, distorted mouth. At Court the Princess had turned her mind to search after lost manuscripts with the Professor, and in the city an uncommon inclination to quaff the punch of the fragrant woodruff-plant was perceptible among the citizens and tempted

them to daring undertakings. Even quiet heads were infected by the intoxication of the season; straw and paper ruled supreme. All the world wore not only hats but also caps of straw; all the world occupied themselves with speculations and new investments. The house of Hahn was in the ascendant. The orders were so numerous that they could not be executed. In all the corners of the house sat girls, sewing straw plaits together; the smell of the brimstone in the street and neighboring gardens was insupportable. In the evenings Mr. Hummel sat on his upturned boat, like Napoleon at St. Helena, a vanquished man. With angry contempt he regarded the tumult of humanity. Repeatedly did his acquaintances call upon him to launch into the great activity of the time, to become a member of some stock-company, to found a bank, dig for coal, or smelt iron. He rejected all these proposals. When he went into his idle workshops, where he was only occupied in a struggle with moths, his book-keeper ventured to make a remark as to the possible future fashions in Parisian hats; he laughed demoniacally and replied:

"I cannot indulge in any speculation as to the covering that people will require when these wild projects cease; but if you wish to know what will be the next fashion, I will inform you. People will wear pitch-caps. I wonder that you are still at your desk. Why do you not do like others of your colleagues, who spend their time in wine-shops?"

"Mr. Hummel, my means do not allow of that," replied the depressed man.

"Your means!" cried Hummel; "who asks after that now? Lucifer-matches are as good as ready money. The street-porters discount bills and give one another their likenesses. Why do you not live like the book-keeper Knips over there? When I bought an orange for my wife of the Italian, I saw him sitting in the back room with a bottle of iced champagne. Why should you not put yourself on ice in this hot weather? These are nothing but ruinous, hare-brained projects; it is a Sodom and Gomorrah; the straw fire burns, but it will come to a frightful end."

Mr. Hummel closed his office and walked in the twilight into the park, where he wandered up and down on the frontiers of his territory like a spirit. He was awakened from his meditations by the wild barking of his brindle favorite, who rushed up to a bench in a shady part of the park, and savagely seized the boots and trousers of a man sitting there. Hummel approached nearer; a small man and a young woman hastily separated. Hummel was sufficiently man of the world not to let himself be seen, and he hastened back to his garden and continued his walk in wild strides.

\* Translation copyrighted.

"I knew it; I always said so; I have given a warning all along. Poor devil!"

Then he walked angrily towards the great beech-tree on his own premises and forgot the supper hour, so that his wife had to call him twice from the garden. When he was sitting at table also he looked as dark as a thunder-cloud, and expressed such a deep contempt for human nature that the ladies soon became silent. Laura made another effort to lead the conversation to the wife of the Burgomaster, who had shown great respect for Hummel whenever she passed by, but he broke out with the terrible words:

"She is no better than the rest of womankind."

"That is enough, Hummel," exclaimed his wife; "this conduct is very unpleasant, and I must beg of you not to indulge so far in your ill-temper as to let it deprive you of a proper judgment of the worth of women. I can forgive much, but never an insult to the nobleness of human nature."

"Away with you and your noble human nature," replied Hummel, rising from the table, and pushing back his chair; he then rushed vehemently into the next room, where, in the dusk, he continued pacing angrily to and fro, for he was much disturbed about Gabriel. Certainly the social position of this man was not exalted; he was not a relation, not a householder, not even a citizen. Accordingly, Mr. Hummel revolved in his mind whether an interference in the secret feelings of this man became him. He did not come to a decision without a struggle, but he could not silence the voice which sounded in the corner of his heart in favor of Gabriel.

Meanwhile, the ladies were sitting at their disturbed repast. Laura looked down gloomily; such scenes were not new to her, and they became more painful. The mother was in great consternation at this anger against the world of femininity, and sank beneath the waves of stormy thoughts. At last she came to the conviction that Hummel was jealous. That was very ludicrous, and there certainly was no cause for such a feeling, but the vagaries of men were incalculable. The comic actor had come the day before at her invitation, and he had been very entertaining; he had enjoyed the wine and dinner, and on taking leave had kissed her hand with a true theatrical expression. Was it possible that this expression had produced the mischief? Mrs. Hummel began to pace up and down, looking in the mirror in passing by, and determined, like a valiant housewife, to hold forth to her husband this very evening on his folly.

"Go up stairs Laura," she said, softly, to her daughter, "I wish to speak to your father alone."

Laura silently took the candle and carried it to her private table. She placed herself at the window and looked toward the neighbor's house, where the Doc-

tor's lamp still glimmered through the curtains. She wrung her hands, and exclaimed:

"Away, away from here; that is the only way to save myself and him."

Meanwhile, Mrs. Hummel had the supper removed, and, mustering courage for the impending encounter, at last entered the room in which Mr. Hummel was still blustering about.

"Henry," she began solemnly, "are you yet in a state of mind to consider calmly the circumstances which have robbed you of all composure?"

"No," cried Hummel, throwing a boot at the door.

"I know the cause of your anger," continued Mrs. Hummel, looking modestly down. "No explanation is necessary for that. It is possible that he may sometimes have ventured more than was necessary in looks and small remarks; but he is amiable and full of talent, and we must make allowances for his vocation."

"He is a miserable fop," cried Mr. Hummel, hurling his second boot from him.

"That is not true," cried Mrs. Hummel, warmly. "But if it were, Henry—even if you could judge him utterly unworthy,—do not forget that pride and a feeling of duty dwell in the heart of your wife, and that your suspicion is an insult to these protecting genii."

"She is a coquettish, silly flirt," replied Hummel, dragging his slippers from under his bed.

Mrs. Hummel started back horrified.

"Your wife has not deserved this treatment. You tread under foot what should be holy to you. Come to your senses, I conjure you; your jealousy approaches to madness."

"I jealous of such a person!" cried Hummel, contemptuously, vehemently knocking the ashes from his pipe. "Then I must indeed be out of my mind. Leave me in peace with all this nonsense."

Mrs. Hummel seized her pocket-handkerchief and began to sob:

"He has so often amused me; he tells anecdotes as I never heard any one in my life; but if he excites you, so that you lose your reason and insult your wife by calling her names, I have made many sacrifices during our wedded life, and he also must fall on the altar of domestic peace. Accept it, he shall never again be invited."

"Who is he?" asked Hummel.

"Who but the comedian?"

"Who is she?"

"Mrs. Hummel gave him a look which showed indubitably that she herself was the lady.

"Is it possible," exclaimed Hummel in astonishment, "that is how the land lies? Why do you want to slaughter your theatrical buffoon on the altar of domestic peace? Rather put something slaughtered before him; that would be more agreeable to his culti-

vated palate. Be composed, Philippine. You are often unintelligible in your speeches, and you make too much ado; you spin your theatrical webs in your head, and you have your humors and confused ideas in general; but for the rest, you are my worthy wife, of whom no evil shall be thought either by myself or others. Now do not thwart me, for I have determined to write him a letter."

While Mrs. Hummel, stupefied, seated herself on the sofa, and considered whether she should be mortified or tranquilized by her husband's praise, and whether she had been under a foolish delusion, or that her Henry's madness had taken the new form of *bonhomie*, Mr. Hummel wrote as follows:—

"My Dear Gabriel,—Yesterday, on the 17th of this month, at 7.45 in the evening, I saw, on bench No. 4, on the common, Dorothy from over the way sitting with Knips junior. This is for warning and further consideration. I am ready to act according to your orders. Straw, Gabriel!—Your affectionate

H. HUMMEL.

By the same post a letter flew from Laura to Ilse in the Pavilion. The faithful soul wrote sorrowfully. The little quarrels of the house and the neighborhood vexed her more than was necessary. Of the Doctor she saw little, and what was the bitterest grief for her, she had given away the last song; she had nothing more to send to the Doctor, and wished to continue the correspondence without inclosures. Ilse was greatly surprised by one sentence, the sense of which was not very clear to her: "I have obtained permission from Miss Jeannette to give lessons in her institution. I will no longer be a useless bread eater. Since I have lost your society all is cold and desolate about me. My only comfort is, that I at least am prepared to fly into foreign parts, and there collect the grains which I need for the prolongation of my life."

"Where is my husband?" asked Ilse, of her maid.

"The Professor has gone to her Highness, the Princess."

"Call Gabriel."

"He has received bad news, and is sitting in his room."

Immediately afterwards Gabriel entered, with a distressed countenance.

"What has happened?" asked Ilse, alarmed.

"It is my own affair only," replied Gabriel, with quivering voice; "it is no good news that this letter has brought to me."

He took out of his pocket Hummel's crumpled letter, and turning away, leaned his head against the window-sill.

"Poor Gabriel!" exclaimed Ilse. "But there may still be some explanation to justify the girl."

"I thank you for your confidence in her, Mrs.

Werner," replied Gabriel, solemnly, "but this letter informs me of my misfortune. He who has written to me is true as gold. But I knew all, before I had received it. She did not answer my last letter; she has not sent me the pocket-book; and yesterday evening, when I went out and was thinking of her, a lark flew towards me and sang a song that made me certain of it."

"That is folly, Gabriel. You ought not to let your judgment be influenced because a bird accidentally occasioned you sorrowful thoughts."

"It was evident, Mrs. Werner," replied Gabriel, sorrowfully. "Just as the lark flew up and I was thinking of Dorothy, the words which I heard as a child and which I have not heard since, occurred to me. It is no superstition, and I can repeat the sentence to you:

"Lark, dear lark, high o'er the smoke,  
What new thing have you to tell me?"

This thought came to me, and then I heard, as distinctly as if some one was whispering the answer in my ear:

"Two lovers sat near a hazel-bush,  
The third was crying and moaning;  
The two pass the threshold of Hymen's house,  
The third sits alone and mourns a spouse."

Gabriel took out his pocket-handkerchief.

"That was a certain foreboding that Dorothy had been false to me."

"Gabriel, I fear she was always fickle-minded," exclaimed Ilse.

"She has a heart like a bird," said Gabriel, apologetically. "She is not a serious person, and it is her nature to be friendly with all. That I knew; but her gaiety, light-heartedness, and pleasant jesting made her dear to me. It was a misfortune for me and her that I was obliged to leave her just when she began to favor me and discourage others who were showing her attention. For I know that the book-keeper had long had his eyes upon her, and had prospects which would enable him to marry her; and that was a better provision than I could give her."

"Something must be done about this," said Ilse. "Do you want to go back to the city to ascertain how matters stand? My husband will immediately give you permission. Perhaps it is not so bad after all."

"For me it is as bad as it can be, Mrs. Werner. If you will have the kindness to look after Dorothy, to see that she is not made unhappy, I will thank you from my heart. I shall never see her again. If one loves any one, one should not leave them alone when they are in temptation."

Ilse endeavored to comfort him, but Gabriel's words went to her heart.

"The third sits alone," she repeated, in a tone of sorrow.

*To be continued.*

## BOOK REVIEWS.

OCCASIONAL THOUGHTS OF HORACE SEEVER. Boston: 1888. Published by J. P. Mendum, Investigator Office.

The above little book is the fruit of fifty years of active and enthusiastic literary labor in the cause of truth and progress. Mr. Seever, the editor of the Boston Investigator, represents the standpoint of opposition to Religion. To him, Religion "depends upon credulity," (p. 81). "All systems of faith and religion are got up by man to impose on his fellows." We have often pointed out the one-sidedness of this view of religion and we wish to repeat it here. However, it is to be borne in mind that free-thought had to suffer much persecution before it gained recognition, and we can easily understand how a man who bore the brunt of desperate battles, still sees his enemy in his theological adversary and cannot judge of him impartially.

HIMMEL UND ERDE. Populäre illustrierte Monatsschrift. Berlin: Heft 1-4.

The first four numbers of *Himmel und Erde* are at hand. The new journal exceeds all expectation. It is filled with highly interesting essays on astronomical subjects, treated in a popular style. The many illustrations are well executed and greatly increase the value of the journal.

The society *Urania* of Berlin, which was instituted for the purpose of "Extending the Enjoyment derived from the Study of the Natural Sciences," are the publishers of *Himmel und Erde*. Dr. Wilhelm Meyer, the editor, has procured the assistance of the best astronomical authorities of all countries, those of our own not excepted. The leading essay of the first number is by Prof. J. V. Schiaparelli, "Upon the Phenomena observed on the Surface of the Planet Mars." Professor Förster, of the Royal Observatory of Berlin, and Dr. Meyer set forth the aims of the *Urania*. In the second number of the periodical, the editor begins a series of articles in which he explains in a popular style the structure of the Universe. The journal begins with promise.

## NOTES.

Mr. J. M. Wheeler has completed a "Biographical Dictionary of Freethinkers" which will be published in a few days by the *Freethinker*, London, England, 28 Stonecutter Street.

*Wide Awake* will have in its next number an essay on "The Survival of Ancient Superstitions" in the popular style suited for its bright little readers.

In the *Atlantic Monthly* of February, 1889, Philip G. Hubert, speaks about the New Talking-Machine:

"I really see no reason, says he, why the newspaper of the future should not come to the subscriber in the shape of a phonogram. And think what a musical critic might be able to do for his public! He might give them whole *arias* from an opera or movements from a symphony, by way of proof or illustration."

M. Alfred Binet has written an interesting preface to the American edition of his treatise, "The Psychic Life of Micro-Organisms." Among many important positions taken, our readers will be interested in the opposition of the author to a theory advanced by the distinguished English scientist, Mr. George J. Romanes. Mr. Romanes, in his well known work upon Mental Evolution, assigns the first appearance of the various psychical and intellectual faculties to different stages or periods in the scale of zoological development. Thus, memory begins with the Echinoderms, reason with the higher Crustaceans, and the secondary instincts with insects and spiders. M. Binet characterizes the classification of Mr. Romanes as laborious and anomalous. The criticisms of the French psychologist rests not only upon the authority of many eminent naturalists, but also upon experimental results reached by himself. The work of M. Binet will be published by The Open Court Publishing Company during the present week.

We publish, in the present number, a letter from Mary Morgan (Gowan Lea), the poetess, telling of the origin of the Philosophical Club of Montreal, its scope, and work. It is interesting as typical of the way in which organizations that have later on become great and influential, have originated. We instance the Nineteenth Century Club of New York, founded by Courtland Palmer, and the Metaphysical Club of Boston whose soul and life was the gifted and much lamented daughter of Mrs. Julia Ward Howe, Mrs. Anagnos.

The Chase-Breckinridge Copyright Bill has passed the Senate and is now before the House of Representatives. It is a matter of national honor and pride that this subject be settled, and opposition, on the ground of defects in the bill can only come from confirmed Philistines and morbid Chauvinists. It is a compromise measure and the outcome of years of labor. American authors will be freed from competition with stolen goods. It will make American books cheaper by opening to them the broad home market now supplied with inferior foreign works. American books will have a chance to reach the American people who now read many worthless books by foreign authors reprinted in rival editions, solely because they can be had for nothing. It will take from our country the stigma of being the only great nation in the world which despoils the foreign author. From a purely ethical standpoint our people, one and all, should support it; because it is just and honorable.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the Nineteenth Century is faith in the ideal unities as possible in fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.

Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.

Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents.

God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.

Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents.

The Present Heaven. By O. B. Frothingham. Price, 5 cents.

On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.

A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents.

The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.

Evolution and Religion. By John Fiske. Price, 5 cents.

Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.

The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

Evolution in its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourn and Prof. A. Gray. Price, 5 cents.

Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents.

The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents.

The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. James. Price, 10 cents.

How Shall We Keep Sunday? An Answer in four parts. 1. Sunday in the Bible, by Charles K. Whipple. 2. Sunday in Church History, by Minot J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 104 pages. Price, 10 cents.

Is Romanism Real Christianity? By F. W. Newman and Francis E. Abbot. Price, 10 cents.

The Change of Front of the Universe. By Minot J. Savage. Price, 5 cts.

Natural Religion. By James Vila Blake. Price, 5 cents.

The Family Purse. By James Vila Blake. Price, 2 cents.

The Philosophy of a Strike. By N. A. Dunning. Price, 5 cents.

Uplifts of Heart and Will. A series of religious meditations or aspirations. By James H. West. Price, 20 cents.

An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

## SCIENTIFIC AMERICAN

ESTABLISHED 1845.

Is the oldest and most popular scientific and mechanical paper published and has the largest circulation of any paper of its class in the world. Fully illustrated. Best class of Wood Engravings. Published weekly. Send for specimen copy. Price \$5 a year. Four months trial, \$1. MUNN & CO., PUBLISHERS, 363 Broadway, N.Y.

## ARCHITECTS &amp; BUILDERS

A great success. Each issue contains colored lithographic plates of country and city residences of public buildings. Numerous engravings and full plans and specifications for the use of such as contemplate building. Price \$2.50 a year, 50 cts. a copy. MUNN & CO., PUBLISHERS.

## PATENTS

may be secured by applying to MUNN & CO., who have had over 40 years' experience and have made over 10,000 applications for American and Foreign patents. Send for Handbook. Correspondence strictly confidential.

## TRADE MARKS.

In case your mark is not registered in the Patent Office, apply to MUNN & CO. and procure immediate protection. Send for Handbook.

COPYRIGHTS for books, charts, maps, etc., quickly procured. Address

MUNN &amp; CO., Patent Solicitors.

GENERAL OFFICE: 361 BROADWAY, N. Y.

The West American Scientist,

SAN DIEGO, CALIFORNIA.

## "THE MICROSCOPE,"

FOR 1889.

The leading exponent of Microscopy in the United States.

The representative of what is best, most instructive, and progressive in American Microscopy.

An enterprising and liberal purveyor of Microscopical News selected from the most reliable scientific journals of Europe and America.

A reliable teacher for the beginner, and a medium through which advanced workers publish to the world the results of their labors.

Among the contributors to this journal are:

Prof. CHAS. E. BESSEY, University of Nebraska.

Prof. T. J. BURRILL, University of Illinois.

Prof. M. D. EWELL, Northwestern University.

Prof. J. WALTER FEWKES, Harvard University.

Prof. C. H. STOWELL, University of Michigan.

Prof. S. H. GAGE, Cornell University.

Prof. H. L. SMITH, Hobart College.

Dr. ALFRED C. STOKES.

Prof. JOHN A. BRASHEAR.

Prof. HENRY MILLS.

Prof. H. M. WHELPLEY.

Dr. F. L. JAMES.

E. H. GRIFFITH, Esq.

C. M. VORCE, Esq.

And many other well-known writers on microscopy.

Each number is replete with information valuable to educated Americans who desire to acquire a scientific knowledge in its broadest sense.

## THE LEADING ORGAN

of British Thought on the American Continent.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$5.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,

5 Jordan Street,

Toronto, Canada.

✓ Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

 NEW YORK

## LUCIFER THE LIGHT BEARER!

Holds to-day the Position of Advance Picket on the Danger Line of the Army of Aggressive and Progressive Journals. For more than two years it has been singled out for prosecution in the Courts by the enemies of Free Speech and Free Press.

Ninth year of Publication. Published weekly at Valley Falls, Kansas at one dollar and twenty-five cents per annum. Send twenty-five cents in stamps for a trial subscription of three months.

## Recent Contributions to 'The Open Court.'

## THE UNIVERSAL FAITH.

By T. B. WAREHAM..... In No. 71.

## THE FOUNDER OF THE NINETEENTH CENTURY CLUB.

By MONSIEUR D. CONWAY..... In No. 71.

Two important and interesting articles upon the life, work, and influence of the late Mr. Courtlandt Palmer, of New York, the liberal and high-minded founder of The Nineteenth Century Club.

## ECONOMIC CONFERENCES.

WHEELBARROW..... In Nos. 37, 40, and 47.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

## Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the sanction of the Author. Treating of the following subjects:

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animals.
4. Colonies of Unicellular Organisms.
5. Foundation of Proto-Organisms.
6. Foundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instance, apart from the author's original investigations, the researches of Bulbini, Claparède and Lachmann, Maupas, Ribot, Haeckel, Engelmann, Espinas, Rouget, Weber, Pfeffer, Kört, Dujardin, Gruber, Naubauer, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Mr. C. J. Romanes, that the first appearance of the various physical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 135 pages. Cloth, 75 Cts; Paper, 50 Cts.

## TRUTH AND FICTION.

BY DR. M. WILHELM MEYER, OF BERLIN.

Translated from the German by JUKK.

Setting—a landscape in Spain. A balmy summer night. Beams of moon-light shimmering through the trees. "I had not long been walking back and forth, when I saw a sudden flash of light, that cast a golden radiance upon the trees and coppice far about. I glanced up, with a start, and beheld in the air a ball of fire, that seemed to hover in the distant space beyond the moon, and slowly to sink towards the spot where I was standing.... The fire-ball, which constantly increased in size as it approached, burst close above me with a loud report, and in its stead I saw a wondrously beautiful woman upon a chariot of blazing carbuncles, drawn by two fire-colored, winged dragons. Round about her, upon a light silver-tinged cloud, fluttered a host of Salamanders, in the shape of winged Cupids, of supernatural beauty. Her wavy tresses were like ringlets of sun-beams, her wings like flames of fire, her body whiter than driven snow in sun-light, and the roseate colors of morn played fantastically upon her cheeks and forehead."

The above remarkable observation was made by that intrepid hero, the youthful Don Sylvio of Rosalva, for whose veracity I have the competent authority of our patriarchal poet, Wieland. For my part, and in all honesty, I doubt not a moment that our youthful cavalier of fairy-land distinctly saw with his eyes the phenomenon above described.

But let me be permitted to add what I take the meaning of "eyes" in this case, to be. These flashing, presumptuous things, that from both sides of the nose seem to project out into the wide universe, and making the journey from star to star in a second of time, fancy they are able to pass from one eternity to another—these eyes into whose shadowy depths one often looks as into an abyss, unfathomable, unlimited, leading to bounds beyond the created world and to the soul of man no longer part of earthly things—these eyes, I say, so far as we can grasp them, are withal no more than windows in a house wherein some man may possibly live and whence he may look forth into the universe. If nobody stood behind the windows, they of themselves would certainly see nothing of the

world. The man behind our windows of eyes is the mind. The impressions that are formed upon the retina, through the medium of the crystalline lens, are telegraphed by the optic nerves to the mind, as perfectly as circumstances allow, and the latter, if so disposed, forms from the dispatches he has separately received, an intelligible and connected whole. As a rule, and unless taken up with some particular whim, the mind from the very nature of its office is constantly bent upon arranging everything telegraphed to it into intelligible interdependence, and never stops until it finds that everything is properly in its place. If something is telegraphed, perchance, that at first sight appears absurd and of which the mind has never in its life heard before and consequently cannot unravel, it endeavors in such cases to attain peace of soul by autocratically asserting its authority as a court of last appeal and maintaining simply that the despatches have been tampered with; whereupon it commissions that imperious, flattering, cosmopolitan damsel, Imagination, to rectify the reports at her pleasure. Thus does the mind willfully hoodwink itself, for the purpose merely of upholding, at any price and with an eye to pious comfort, a conception of the world which it has previously formed, and which it has fashioned and elaborated with loving care. And so it comes that the poor corporeal eyes have nothing whatever to say, and more than that, that we do not know at all exactly what they really do see, or how the world really is made.

Among the different organs of sense no night-watch has, as a rule, been introduced. When the time to sleep comes, the telegraphists stationed at ears, eyes, and remaining senses, naturally grow weary. The shutters are closed and we go to sleep. Even the court of last resort, that thing so hard to define, which, having to give it a name, we have called the mind, condescends on such occasions to share this rest. But, sometimes, in the middle of the night, it occurs to it to get up again—not, however, to assert itself as a stern executive clothed with authority, but to seek amusement as a private citizen in a world of its own making, unobserved by its slumbering subordinates in office:—we dream. We see, hear, and feel, in such circumstances, exactly the same as if the administrative machinery of the human body politic were in complete and conso-

nant movement. Here, the inward man acts entirely upon his own score.

Sometimes, though, matters go further. The ambitious personage at the head of affairs, who just in the night-time feels himself especially at liberty and so hits upon all sorts of strange ideas, often takes it into his head to rouse a number of his deputies and press them into service to carry out his knavish projects. The engineers that work the arms and legs at sovereign bidding, have to resume their duties. They are accustomed, since time out of mind, to carry out with slavish conscientiousness the work imposed upon them; and now they put the human machine into motion after the old fashion. We walk in our sleep, in pathways that we build in fancy; and while tripping about in the moon-light upon the roofs of houses, we fancy perchance we are hastening to a longed for rendezvous in a garden of oriental beauty. So long as the timorous and troublesomely pedantic inspectors stationed behind the ears and eyes, otherwise ready to telegraph every danger that threatens, are fast asleep, so long can we act as we please. Beware, however, of waking the man who is walking in his sleep. If you shout at him, the timorous inspector first starts up. This gentleman is at once seized with consternation at the noise, tears open the shutters, the telegraphists rush to their instruments and at once a hundred dispatches fly over the lines, announcing the dangerous situation at the seat of sovereign authority. As a consequence of the universal dismay, the mind is also struck with terror. "Mercy on us! What shall we do?" It telegraphs in every direction; and from every direction comes the answer: "Tumble from the roof, as people always do when they are in your fix." And he tumbles.

The case may occur too, that at times when the other functionaries are sleeping, the telegraphists behind eyes and ears may be half-awake, and though in an uncertain and stupefied condition, yet mechanically perform their duties. In which case incomplete dispatches arrive at headquarters and the man at the head of affairs fills them out as he pleases; and endeavoring, of course, to adjust matters as speedily as possible, gladly and involuntarily, as it were, accepts any suggestions that another person, completely awake, bids him senses telegraph him in explanation of what he has perceived. This condition of affairs is called hypnotic sleep. Here, the connection between the sensory instruments and the mind is only partly broken, and the electric battery is, so to say, poorly filled. We give the hypnotized subject a lemon. The image of the lemon will be formed of course upon the retina of the open eye. But the senses do nothing more than send an unintelligible telegram to the mind that the person has an article in his hand of indefinite color and indefinite character. The situation disturbs the un-

sleeping mind, which never likes to be aware of the presence of a thing without knowing its qualities, which might indeed be dangerous to life. Hereupon a bystander says to our subject: "That is a beautiful, sweet apple you have there, my friend; why do you not eat it?" This announcement is immediately and gladly accepted by the perturbed mind. Of course! Plainly, that is an apple! And our subject takes a bite of it. The gustatory nerves receive a tremendous shock. But here too the connection with the mind is imperfect. The dispatch contains merely information as to a sensation—whether it is sweet or sour, it does not say. But the mind at once completes the dispatch in accordance with the idea previously transmitted to it. To it the object is a sweet apple, and the sour lemon is devoured with an expression of the most appreciative enjoyment.

If, now, the person were suddenly aroused from the hypnotic sleep, he would at once have the sour taste in his mouth, and would spit out, in disgust, what was left of the lemon. For now the dispatch from the gustatory nerves arrives in the mind in an un mutilated condition, and the latter is enabled to form its own judgment, which says that the lemon is sour.

This explanation of the hypnotic state appears to me the simplest, and that which most fully harmonizes with the experiences which a person in the normal state has with his own mind. It is a question of existence with him to find the quickest possible explanation for things about him. To this end he employs the testimony of his external senses. The connection between the mind and the senses, however, works poorly during hypnotic sleep. This induces a feeling of insecurity, and the hypnotized subject clings unconditionally to the explanations which another person in whom he has confidence makes by word or gesture. Thence also the power of the hypnotizer, which is only effective with believing subjects, who from the start recognize that the operator is intellectually their superior.

I believe, too, that there actually are people who see spirits with their open eyes and when really awake; presupposing, of course, that the persons in question are previously versed in spirit-lore or are at least inclined to believe that under certain circumstances supernatural beings can come down to us—whether directly from heaven or from the fourth dimension of space, it is immaterial.

It is in the night. From the moon-beams shining through the blinds the room is filled with a dim light wherein the eye, I mean the bodily eye, can see nothing with distinctness. In this case, therefore, it is the fault of the outer organ that the dispatches arrive at headquarters in an incomplete form and, frequently, unfit for purposes of explanation. A condition of mind,

consequently, quite similar to that of persons hypnotized, can easily occur in the present instance. Here the sense of disquiet and insecurity noticeable, is caused by the defective perceptive capacity of the outer organs in the flickering twilight, and in the state of hypnotism it is caused by the defective transmission of distinctly received impressions resulting from the poor conductive capacity of the telegraphic connections between the senses and the mind. In both cases imagination has to lend its assistance, to satisfy, by a trick of self-deception, the crying demand for causal interdependence.

A light draft of air is passing through the spacious halls of a mansion-house, wherein one is walking about alone, listening to the re-echoing foot steps, feeling here and there, and glancing about in timorous uncertainty. The wind touches us as with a thousand fingers of swiftly passing, bodiless beings. Suddenly something stirs behind the door of the next room. The person had not been looking directly at the spot, but he had noticed that a shining white body had slowly and noiselessly passed back of the doorway. Terrified, he quickly turns towards it. If he had been looking in that direction a moment before, he would have seen that it was a white curtain which had been lifted away from the window for a moment by the wind, and that a streak of moon-light had flitted lightly through. The curtain has fallen again now. But in the short space of time that the timorous observer takes to direct his eyes squarely upon the spot, a great mass of inferences has been arrived at. "That is a ghost. I saw it almost directly. I shall get a full view of it in a moment now." The imagination at once comes into active play, and while the corporeal eye really sees nothing, the imaginative faculty rapidly creates the image to harmonize with the generally accepted idea of how such things ought to be. The spiritual eye steps into the place of the bodily eye, which refuses all participation in the affair, and the subject sees perfectly well with the former everything that the circumstances of the situation demand of it.

The confounding of the spiritual with the corporeal eye can be so completely effected withal, that a person deceived in this manner will take in perfect faith the most sacred oaths upon having seen with his own eyes everything that his imagination has thus conjured up before him. This is why I believe everybody, upon word, when they tell me they have seen a ghost.

And so—to credit the reliable account of Wieland—did it happen to the youthful Don Sylvio, in whose ideas of the universe there existed fairies and salamanders just as surely as there do kings and presidents in our own. He was disturbed with the thought of how he was to find his beloved princess, who had been transfigured into a butterfly, and this thought engaged his

whole attention. Suddenly, there appeared before his eyes a brilliant fire-ball as big as the moon, which flooded the landscape far about him with light of spectral transplendency. The marvelous phenomenon speeds earthward in rapid flight, and right above the head of the youthful cavalier, who half from delight and half from fear stands spell-bound by, the fire-ball bursts with fearful detonation; the glowing fragments fly like burning carbuncles through the air, and silver cloudlets tinged by the light of the moon take their place.

Thus far the description may correspond perfectly to reality. But now comes the element of fiction, whereby the strange phenomenon, so mysteriously appearing, sought and found an appropriate place in the young observer's ideas of cosmic order. That radiant object, soaring towards him from transmundane parts, could be nothing if not the intervention of a higher power in his fortune and course of life. The fire-ball vanished as quickly as it had appeared; the eye of the body ceased to furnish further material. But the imagination, too powerfully aroused by the gorgeous and unfamiliar spectacle, causes the inward eye to continue seeing what is further pleasant and acceptable to it. The change of rôle is effected so quickly, that the observer takes no note of it. The fairy is thus a natural metamorphosis of the fire-ball, and the rest follows of itself.

My readers may interpose the objection, perhaps, that I have occupied myself unnecessarily at length with the interpretation of a poetical fancy of Wieland. On the contrary.

I believe, indeed, that every creation of fancy receives its primal impulse from a materially real event; that the faculty of imagination is to be compared to a keg of powder, which lies inert and ineffective until a spark of real fire falls into it. The liberating force may be ever so feeble in comparison with the tremendous effect so suddenly produced; and yet without that impulse this effect could never have resulted.

The fanciful vision of the fire-ball and the fairy form emerging from it, we must assume to have arisen from some actual occurrence; and the material truth of the picture represented up to the point where the transcendental lady appears, the phenomena accompanying it, the serpentine flames curling about the bursting meteorite, the glowing body set with carbuncles that falls from it, the white clouds that encompass it, unequivocally pronounce that the poet had witnessed a magnificent phenomenon of this kind himself, and that a similar train of thought to that above sketched had led him to the development of the psychological processes imputed to his hero:—a scene painted with such exquisite marks of observative talent as to appear to us almost natural.

But I propose to go still further, and shall undertake to show that when brought face to face with extraordinary phenomena, suddenly appearing, we all of us belong to the category of fairy-knights and ghost-seers; and that we see events, for the time unexplainable, just as the spiritual eye pleases to see them.

On the fifth of December, 1880, at twenty-nine minutes after seven in the evening, a fire-ball swept across the city of Geneva, illuminating the entire adjacent district, for about two seconds, with a gorgeous bluish light. I chanced to be in a narrow street at the time and was only able to see the bright glare. Our machinist at the observatory was more fortunate. I reposed full confidence in his reports, for I had reason to assume that he suffered more from paroxysms in the legs than from illusions in the head. He told me that the fire ball appeared about three times smaller than the moon and had fallen perpendicularly towards the western horizon, where, before reaching the same, it vanished, without bursting apart and without making any noise.

If similar reports had been attainable from observers who had followed the course of the phenomenon at a distance of some miles from the city, I would have been in a position to fix the true path of the fire-ball, independent of our terrestrial position, and to ascertain in what direction from the wide regions of universal space it had descended, and at what height it had passed over us. I accordingly published in the *Journal de Genève* a request to that effect, and received in answer scores of letters. Among them were three, whose writers thought it incumbent upon them to preface their account with the highest moral assurances of their credibility, and who all saw the meteor fall to the ground at a short distance from where they were standing, but every one of them at a place which lay miles away from the stations of the other two observers.

The first observer had seen the meteor burst just above the trees skirting the banks of the lake, in a suburb of Geneva. The fragments had shot through the branches of the trees and fallen upon the pavement below, where they broke in pieces, with a clatter and amid a shower of sparks. The people had run towards the spot, but could discover nothing. My reporter was looking from a window of his dwelling-house, some twenty yards away from the scene, and had observed the occurrence without possibility of deception. I subsequently examined the place described, saw nothing, however, to raise suspicion, and could find no black marks whatsoever upon the pavement. The second observer had seen the meteor, at the end of its course, fall between the spot where he was standing and the chateau of the Chevalier de Beaumont, in Collonge—a village situated at the foot of

the Salève, about a league from Geneva. The meteor must certainly have fallen in the garden there. Here too all investigation was fruitless. My third informant, finally, contended with the pertinacity of a Galileo, in opposition to all other reports, that the fire-ball had plunged into the lake, by Chillon. The famous castle laved by the waters of Lemán, that formed the brilliant theme of Byron's immortal poem, had loomed forth from the darkness, at that moment, in phantomlike grandeur and truly spectral splendence. The distant snow covered peaks of Savoy, and the dancing waters beneath, seemed flooded in the blue light with an indescribable and magical radiance. Then the meteor had plunged straight downward before the shimmering, light-flooded mountains; the latter were plainly visible behind the flaming ball, and a moment later it had vanished in the hissing waters. And then all was darkness again.

It was easily proven, in contradiction of the descriptions sketched above, that all three witnesses of the phenomenon were mistaken. For as no detonation was reported—although the meteor was visible from its brilliant glare within a range of at least twenty miles—it never could have fallen to the earth: a noiseless fall of a meteor of equal brilliancy never occurred, and besides, from physical reasons, it is impossible.

Although I was unable, from the extremely contradictory reports given, to fix a definite path as the course of the meteor, yet it is undoubted that the fire-ball swept over Geneva at a distance of several leagues, and probably never came nearer to the earth. The dazzling light into which the fire-ball suddenly blazed, and its course which led almost perpendicularly to the horizon, had at once convinced all who witnessed the phenomenon that the meteor was in their immediate vicinity and was descending towards them. All the faculties of the mind, and particularly the ever ready and helpful faculty of imagination, had been brought into active and rapid play by the extraordinary sight, and upon the sudden and unexpected disappearance of the brilliant object could not be brought immediately to a state of rest. That which they expected to see a moment later, they in fact did see quite distinctly—of course, with the inner eye only, the corporeal eye suddenly ceasing to furnish further accounts. Only after the occurrence had come, in consonance with our ideas, to a proper termination—in other words, when the meteor had fallen to the pavement, in the garden, or in the lake—did the spiritual eye discontinue to make its observations. The deception was so complete that one observer had distinctly heard the rattling of the fragments upon the side-walk, and another the hissing of the water when the meteor struck the lake. Imagination had in each case occasioned the entire deception.

From this and various other circumstances the apparent result inferable is, that the functions of the mind are subject to a kind of law of inertia, by virtue of which the mind is to be brought only with difficulty into a definite direction; yet when once forced into activity by a powerful impulse, it is unable immediately to stop upon the cessation of the originating impulse, but continues, for a while, undisturbed in its progress, until finally the friction from the evident inconsistency of appearances become too great.

### JIM THE INVENTOR.

BY WHEELBARROW.

My friend Jim Short is a mechanic; and what is more, he is a genius in mechanics. Had he been simply a mechanic he might have prospered and made money, but being a genius he has accumulated nothing but glory, on which he will receive no dividends in this world. They will all go to the multitudinous corporation known as Homo Brothers and Co. It is a surprise to Jim that this practical epoch does not use genius well. It has neither time nor money to waste on theoretical men. After a long and weary search, Jim Short has discovered the principle of perpetual motion, and he has invented a machine to utilize it for the abolition of hard work. It needs only a few more wheels and pulleys to make it perfect, and then the social problem will be solved; we shall need no exercise, but play. It unites the virtues of the philosopher's stone, the elixir of life, and the Balm of Gilead. It is the supreme panacea which, like Aaron's rod, shall swallow all the rest.

They give no credit at the patent office, and they refuse to issue patents on ideal inventions. They will not accept promissory plans, models, and specifications latent in the inventor's brain. They insist on realities made of wood, and leather, and iron. This is the prosy reason why Jim has not received a patent for his promise of "perpetual motion." His models contain cogs, wheels, concentrics, eccentrics, and pulleys enough for twenty patents, but because they lack just two trifling elements, a lever and a fulcrum, the department absurdly refuses a patent, and what is worse, the government declines to furnish genius with money enough to supply the missing powers. The people refuse faith, and the government refuses money. That Jim's manifold patterns do not work is no fault of his, but of the heedless government which declines to render him substantial aid. His efforts being for the benefit of all the people, Jim thinks that the government should subsidize his genius or at least encourage it with a pension, that he may pursue his experiments above the cankering fear of poverty. Morse received a subsidy for a promise of quick motion, and why should not Jim receive a like stimulus for his

promise of perpetual motion? He wants a few immediate assets and there are none in the assurance that he shall be renowned in after ages like Watt and Stephenson.

Jim's definition of his perpetual motion machine is this: he describes it as a mechanical contrivance that needs no food and works for ever. It is the one great miracle under the sun. The skeptical crowd laugh kindly at poor Jim as a visionary in mechanical economy. They easily detect the flaw in his logic, but with childish credulity they pin their own faith to inventors in political economy more visionary than Jim. His theory is a panacea that works in all emergencies and cures everything; so is theirs. Each of them declares that he has discovered the secret of perpetual motion, and as soon as he can supply a lever and a fulcrum to his machine he will abolish every form of social disease. Jim is not alone in fairy-land. The woods there are full of dreamers fantastical as he.

Forty-five years ago, there was a social reformer in England, who found "perpetual motion" in the spade. His theory was to abolish the plow and divide England up into four-acre farms, to be cultivated by the spade alone. This would give employment to everybody, and poverty would cease to be. He was correct, because it is very plain that to cultivate all England with the spade would require the muscle of all her people. He put more than a million dollars into his experiment. He bought large tracts of land, divided it up into four-acre farms, armed his "freeholders" with spades, and set them to work. The scheme failed, and the failure broke his heart. In his efforts to find the missing lever, fulcrum, or whatever it was that his machine wanted, he became insane, and died at last in the lunatic asylum.

A very popular "perpetual motion" machine is the panacea known as the single tax on land-values, which is to abolish poverty. In fact the proprietary name of it stamped upon the bottles, is "Anti-Poverty." All other preparations for abolishing poverty are counterfeit. Another inventor, of the type and quality of Jim, assures me that he has discovered "perpetual motion" in State Socialism, where all of us are to be absorbed into that ethereal Nirvana which is called "government," wherein we are to live and move and have our being. Another tells me that he has found "perpetual motion" in the principle of individualism, or anarchy, where government is unknown because unnecessary; where every man is his own policeman, clubbing himself over the head whenever he does wrong and continuously taking himself into custody. Another assures me that he has found the great principle in mutual banking and an unlimited supply of paper ten-dollar pieces. When every man has a pocket full of bank stock, Utopia becomes a geographical fact. When

we can draw on the bank for whatever amount we need by simply depositing a philosopher's stone in the safe, "perpetual motion" becomes a crystallized reality. I have a friend, an editor of a newspaper, who writes me that he has found "perpetual motion" in a graduated income tax by which every man is to be fined in proportion to his prosperity, the fines to go to the unprosperous. He does not know that this was one of the resources of the French Republic, a hundred years ago, by which "equality" was to be established among all the people.

Jim, the inventor, is not alone in his theories of "perpetual motion." He has the company of hundreds, who believe that they have solved the riddle of ages, and that their special inventions, if they can only get them patented, will bring the millennium in.

#### AXIOMS THE BASIS OF MATHEMATICS.

BY DR. EDWARD BROOKS, OF PHILADELPHIA.

In an interesting discussion by the editor of THE OPEN COURT it is stated that "mathematics is unfortunately constructed on axioms," which gives to it "an air of mysteriousness," and led Schopenhauer to declare that "the whole science, being based upon non-proven truths, remains non-proven." Of course any one who is familiar with the spirit of modern philosophical thought, will readily understand the reasoning that leads to this conclusion; but it is a position so different from the usually accepted one that it always invites discussion. My own conception of the subject points to a different conclusion, and I throw together a few paragraphs in the line of this thought.

I begin by saying that there are some things of which we may say, *they exist, they are*. The universe is; both monism and dualism assume the existence of a something, or an aggregation of things, which we call the Universe. So also it is assumed that thought is, that a something (brain or mind) which thinks is, that the laws and principles of science are. All thought is based on the assumption that some things exist, that there is a certainty of their existence, and also that there is a certainty that we know they exist.

Moreover, there are existences which are not material, as space, time, feeling, thought, etc. The paper upon which THE OPEN COURT is printed exists, it has length, breadth and thickness; length, breadth and thickness are possible only in space, therefore space also exists. Mr. Gladstone is eighty years of age, the time he has lived is an actuality and cannot be destroyed. This time is possible only in the great fact of Time of which the eighty years are a part; hence there is an existence which we call Time. The paper of THE OPEN COURT not only exists, but the ideas and truths which it contains, also have an existence; hence

thought and the great truths which it discovers or evolves, are actual existences in the universe.

And again, some things not only exist, but their existence is a necessity. Nothing can overthrow or destroy their existence. They exist independently of all conditions, and are subject to no contingencies. They are an essential part of the universe, without which there could be no known or conceivable universe. Space exists as an essential condition for the existence of matter, but space would continue to exist even were all matter destroyed. I am aware that the truth of the statements of this paragraph will be questioned, but though they are not necessary to my argument, I let them stand as indicating the line of my thought.

Now some of the above statements are true, or else the statements of their opposites are true; hence there is such a thing as Truth. Some truths may be derived from other truths: thus, if it be true that "all men are mortal," then it is also true that "some men are mortal." Such a derivation of one truth from one or more other truths is called reasoning. Reasoning is based on laws of inference, which are also truths. All reasoning can be traced back to truths which cannot be derived from other truths, and hence are not the result of reasoning. Such truths, undervived from other truths, are called *axioms*. These axioms used in geometry relate not only to quantity but also to logic, for every syllogism proceeds by a self-evident truth of inference. Now because these axioms are not proved truths, Schopenhauer and others claim that the truths derived from them are themselves unproved.

Let us see how much force there is in this assertion. We begin with our first proposition that something is. This applies not only to material things, but also to laws, principles, truths, etc. The truth of a theorem is a something that has existence as much so as a tree or a mountain. It is an existence, too, that is stable and unchangeable. The tree may disappear, the mountain may be leveled or sunk in the ocean, but the truth of a mathematical theorem will never change. The truth that "two straight lines cannot inclose a space," or that "a straight line is the shortest distance from one point to another," will always remain true.

These truths of mathematics are especially noted for their certainty. Of the cognitions in the domain of sense we may be mistaken; we may think we see a cow in the meadow, when there is only a speck on the window pane. But there is no uncertainty attending the truths of arithmetic and geometry. We may infer by induction that heat will expand all metals; but we are never sure that a metal may not be discovered which would prove an exception to the law. In the case of mathematical truths, however, we are certain that there can be no exception. We are absolutely certain, for instance, that no case can ever be found in

which the cone is not equal to one-third of the cylinder with the same base and altitude. If we should make vessels of these forms and, testing it with water, not find it verified, we would doubt the correctness of our experiment, but never the result of our reasoning in the demonstration of the truth stated. These truths of mathematics are thus especially distinguished for their certainty and the impossibility of any exceptions.

Again, some truths are not only true, but they are necessarily true. This is especially the case with mathematical truths. Thus, "the sum of 2 and 3 is 5," is not only true, but is necessarily true. No power or circumstances can make it otherwise. So also the proposition that "the sum of the angles of a quadrilateral equals four right angles," or "the sum of the angles of a pentagon equals six right angles;"—they are not only true, but their truth is a necessity. No change of form or size will affect these principles of plane polygons; they have always been true, and will always be true. So also "the square on the hypotenuse equals the sum of the squares on the other two sides" is a truth which is not only certainly true, but is also necessarily true. No right-angled triangle can be made in which the sum of the squares in the two sides will differ by the smallest quantity from the square on the hypotenuse.

Now, we not only have truths which are necessarily true, but the mind has the power of knowing that they are necessarily true. I know that I am writing this article; and I know that the statement just written is true. We can know positively also that a truth derived from another truth, by the laws of reasoning, is true. Thus the mind has the power of knowing a truth to be true, and also of knowing it to be necessarily true. We not only know that "2 and 3 are 5" is true; but also that the sum cannot be 4 or 6 or anything but 5. We know that no power can cause the square on the hypotenuse to differ one iota from the sum of the squares on the base and perpendicular. We therefore know the necessity of truths derived by the laws of reasoning from axiomatic premises. In all this there is no mystery, but a clear conception of both common sense and philosophy.

But now what of these first truths from which or by means of which we derive these other truths? Well, first, we assert that they are true, and that we can know they are true. Second, we assert that they are necessarily true. The proposition "things that are equal to the same thing are equal to one another" is absolutely and necessarily true. It is impossible for the statement to be untrue. Third, and here is where the difficulty seems to arise, we *have the power to know* that they are true, and also to know that they are necessarily true. No one will question the mind's ability to see that a derived truth is true (assuming that the

premises are true); it is universally admitted that the mind has this power. But, it is equally certain that the mind has the power to see the truth of what are called *first truths* or *axioms*. To deny them is to take a position which we know is incorrect; to assert their opposite is to make an assertion which we know to be false. It needs no argument to prove that the denial of an axiom is false; we just know that it is false and that is the end of it. Our knowing, in these cases, is a finality; and we know that our knowing is correct. In other words, the mind has the power of cognizing axiomatic truths, and of knowing that they are both true and necessarily true.

For instance, I know that "to-day is not yesterday," that "a tree is not a man," that "Mr. Gladstone is not Mr. Blaine," etc.; these and similar propositions I know to be absolutely true, and every one else who understands them knows the same. So also with such axioms as "the whole is greater than any of its parts," "a straight line is the shortest distance between two points," etc.; every one knows them to be true as soon as they are announced or conceived. Such truths which are necessarily true and which we know to be necessarily true, constitute the basis from which the other truths of geometry are derived. These basal truths need no proof; they are self-evident and carry their certainty and necessity in their own nature. As such they afford a firm basis upon which the other truths may securely rest. They are unproved merely because they need no proof. If they could be proved, it would not add to their certainty. A thousand proofs, if such were possible, would not strengthen our faith in them or make them any more certain. It is thus a misleading statement to say that the proved truths of geometry are "unproved," and therefore may possess a flavor of uncertainty because they are derived from unproved truths. On the contrary, the utmost certainty attaches to the truths of geometry because they are derived by laws of inference absolutely true, from previous truths absolutely true. There is no mystery actual or philosophical in respect to the matter; and it is difficult to see how the basing of mathematics on axioms is in any sense an unfortunate one.

But the question may be pushed, How do we know that these axioms are true? I reply, there is no "how," we know them to be true; we just know they are true and that is the end of it. To know how we know them to be true, would be equivalent to proving them to be true, and they are beyond and independent of proof. To prove a truth is to establish it by some other truth; but there are no truths back of or before these axiomatic truths which authenticate them. They are absolutely first truths, underived and self-existent, and as such are cognized by the mind. Suppose I ask you, how do you know that you think; you say you are con-

scious of it, but that is merely saying you know you think. That is all there is in it; you just know that you think; there is no proof of it but your knowledge of it, and you ask for no proof. No one can prove you do not think; and no proof that you do would add any certainty to your knowledge that you do think. Your knowledge that you think is a first truth to you. First truths exist in the very nature of things, they are absolute and necessary; and the mind has the power to cognize them as they are and to cognize also their certainty and necessity. The process, though admirable and even grand, is simple and free from mystery.

And now is it possible to depart from this method of the use of axioms in the development of mathematical science? Grassmann has attempted such a departure; but it is far from certain that he has succeeded. Are not most of his postulates merely axioms in disguise? How does he know that "space has three dimensions;" is not this a cognition of Intuition, "a truth to be taken on faith?" He never saw a "dimension" or a "point," for a dimension is merely *length*, and length is a conception of reason and not an object of sense. No eye ever saw "a point;" it is seen only "in the mind's eye," that is by the eye of intuition. And then as soon as he begins to reason from these postulates he makes use of axiomatic truths; so that both in his premises and his inferences he makes use of truths which have not been proved, and thus each derived truth of his system is based upon an axiomatic truth either of quantity or logic. And so any attempt to construct a science of mathematics on anything but intuitive cognitions and self-evident truths will be actually found to involve those conceptions and truths. Shall we not be content to "let well enough alone," and rest with absolute certainty on the present system of geometry?

#### COGNITION, KNOWLEDGE, AND TRUTH.

Cognition in its simplest form is the act of feeling a percept to be the same as another percept perceived before. Cognition thus is founded in the relations of our percepts among each other. A single impression cannot as yet constitute cognition; two or several percepts of the same kind are needed in order to feel their identity.

Cognition consists of two elements; it has a subjective and an objective phase. The objective phase is that the object now perceived is the same (or at least in some respect the same) as the object perceived before; and the subjective phase is that it is also felt to be the same. The new percept fitting itself into the form produced in the brain by the former percept, is, in the literal sense of the word, re-cognized: it is cognized again. The condition of knowledge accordingly, in its simplest form, is 'the sameness of two or more percepts.'

Cognition of the higher and more complicated kind remains at bottom the same. It is always the act of recognizing a unity or a sameness in two or several phenomena. Cognition always presupposes a certain stock of experience, and to understand a phenomenon or to explain it means to recognize its identity with other phenomena with which we are familiar. The falling of stones to the ground is a familiar occurrence with us, and to show in how far the motion of the moon about the earth is the same kind of motion as that of the falling stone, only under other conditions, is an explanation of this phenomenon.

Knowledge is the formulated stock of experiences in which we have discovered common features, so that their identity even under different conditions has been and will always again be recognized.

Knowledge in animals is simple in comparison with knowledge in man. Animals easily recognize concrete things and persons, but they are not able to sum up their knowledge in abstract formulas; they cannot name things, they cannot speak, they cannot think in abstract ideas. Man's knowledge rises into the realm of abstract thought where he creates a new world of spiritual existence.

The data of the natural sciences are always certain phenomena of which we are aware by sensation. We classify these phenomena so as to embrace them by the same law in innumerable and, in many respects, apparently different processes. Take, for instance, the tiny luminous specks in the nocturnal sky which we as well as many animals perceive by our visual organs. To the animal the stars are meaningless,\* to the savage they are mysterious beings of an undiscoverable origin; but the astronomer by the aid of computing, and measuring, and calculating, with the additional help of telescopes, arranges in his mind the phenomena of the starry heaven in such a way as to make of his luminous sensations a well-ordered whole, standing in union with all the other facts of our experience.

Abstract ideas, generalizations, and conceptions of natural laws are the most important factors of human existence proper. By the help of abstract thought only has man become man. By the help of abstract thought only can he realize that he is a part of the whole of All-existence: he becomes religious. By the help of abstract thought he can regulate his actions according to maxims of universal applicability, so that he remains in harmony with the cosmical order of the Universe—with God: he becomes a moral being. By the help of abstract thought he can formulate his experiences in the rigid forms of arithmetical, geometrical, mechanical, or logical expressions, so that he comprehends the im-

\* Incidentally may be mentioned, that to the higher animals natural phenomena gain in impressiveness. The monkeys of the Sunda Isles, we are informed, gather shortly before sunrise in the highest tree-tops and salute the first rays of the rising sun with clamorous shouts.

manent necessity of the order of nature: he becomes scientific. When he finds that his abstract conceptions, his ideas, are realized in certain regular or characteristic instances, he acquires artistic taste; and when he begins to express his ideas in a visible or audible form, in colors, in sounds, or in words so that his creations represent single instances, incarnations as it were, of his ideas, he becomes an artist,—a painter, a musician, or a poet. If man succeeds in unifying all his knowledge on a scientific basis, so that it is systematized as a unitary conception of world and life and the aim of life, he becomes a philosopher. Thus abstract thought is the basis of all higher, intellectual, human, and humane aspirations. It raises man high above all the rest of animal creation and makes him their master. It is the cornerstone of humanity and produces Religion, Ethics, Science, Art, and Philosophy.

Abstract thoughts do not on the one hand represent absolute existences, nor on the other are they mere air castles; they are built upon the solid ground of reality. The facts of nature are specie and our abstract thoughts are bills which serve to economize the process of an exchange of thought. We must know the exact value in specie of every bill which is in our possession. And if the values of our abstract ideas are not ultimately founded upon the reality of positive facts, they are like bills or drafts for the payment of which there is no money in the bank.

Reality is often identified with material existence, as if matter were an exhaustive term for all that is real. Matter is an abstract; matter of itself, absolute matter, does not exist. Matter cannot even be conceived as real unless it is possessed with some kind of force (or motion, or energy); forceless matter is a non-entity. Further, every single particle of matter must appear in some special form. Formless matter is a non-entity also. Matter, force, and form are abstracts only, which we have made for our own convenience of comprehending the phenomena of the world. Reality itself is one undivided and indivisible whole. The most important abstraction among the three (matter, force, and form), we do not hesitate to say is, neither matter nor force, but form.

Matter is a general conception abstracted from things material; it indicates their property of possessing mass and volume, but excludes all special or individual features of material bodies. At the same time, accordingly, it is an extremely poor and empty concept. Generalizations naturally are the more void, the higher they are. The same may be said of motion as well as of force. Motion means change of place; force signifies that which is productive of a change of place. In order to know matter, we must become familiar with all kinds of matter, and in order to know the forces of

nature we must study the natural phenomena, *viz.*, the actual motions that are taking place.

The concept 'form' is not so barren as the generalizations 'matter' and 'force.' We cannot create new matter, neither can we create new force or motion, but we can create new forms. We can in our mind construct new combinations; and if they have been correctly arranged in our thoughts, they will (when an attempt at their execution is made) be seen to be realizable. The laws of form laid down in the formal sciences (in mathematics, arithmetic, pure logic, etc.), can be ascertained by self-observation. While we create new forms in our mind we evolve the more complex combinations from the simple ones and can thus comprehend them. We can, by methodical generalization, as well as consistent application of generalizations to different cases, exhaust the possibility of instances and thus formulate universal rules.

Form constitutes the order of the world, its cognizability and intelligibility. It imparts to the universe the spirituality of its existence. Form and the changeability of form make evolution possible. The evolution of forms brings sense and meaning into the forces of nature; it affords a direction to their movements and determines the progressive character of all growth. Form, a special kind of form, constitutes mind and human intelligence, and the establishment of the sciences of formal thought is the basis of exact philosophy. Form gives purpose to life and the problem of ethics finds in it its solution.

We now ask that often repeated question of Pilate, "What is truth?" Tradition says that Pilate was a skeptic; like the agnostic of modern days, he did not consider it worth his while to wait for a reply. And the gospel informs us that Jesus did not deign to answer him.

There have been complaints that we never can know 'absolute truth'; and indeed 'absolute truth' is unknowable because such a thing as 'absolute truth' does not exist. Cognition is a relation, and truth, if it has any meaning at all, means true cognition. Therefore the very essence of truth is a relation; and this relation is neither mysterious, nor inscrutable, nor unknowable, nor a profound secret; it can be ascertained perfectly well.

A conception, or a cognizance, or a formula of a number of experiences, or an abstract idea is true if it is in unison with all facts of reality; it is not true if in any way it conflicts with or is contradicted by facts of reality. The facts of reality remain the ultimate data of all our knowledge; truth is the unison of our conception of single facts with the whole system of all facts, and science as well as philosophy is our aspiration to realize the unity of nature.

## BYRON.

BY LOUIS BELROSE, JR.

O Singer of the summit and the sea,  
 O lover of the tempest, who divined  
 The language of the lightning and the wind,  
 Byron! the very air is full of thee.

Thy song was of the mountains and the free  
 Far-rolling ocean, where thine ears could find  
 Relief from rattle of the chains that bind  
 The tortured spirit of humanity.

A forest is thy poem, where my soul  
 Roams on through tropic luxury to climb  
 The snow-clad glorious heights that top the whole.

But there be those that root amid the slime  
 For noxious weeds; and when they find, extol  
 The little kitchen-gardeners of rhyme.

In view of the Villa Diodati, near Geneva, 1877.

## CERVANTES.

BY LOUIS BELROSE, JR.

Thou wast a poet after my own heart,  
 Cervantes.—When all Europe's hopes and fears  
 Followed Don Juan, yet a boy in years  
 Lepanto saw thee play the hero's part.

And when thy fortune led thee to this mart  
 Of Islam's foes, although a slave, the tears  
 Of twenty thousand captives in Algiers  
 Fell fewer for thy courage and thine art.

Ennobled by the hand that held the sword  
 With all the soldier's virtues, frank and free,  
 Thy pen spoke plain to rabble, priest, and lord;

Nor was the recompense refused to thee;  
 For parasite and pander swelled the horde  
 That mocked thy wounds, thine age, and poverty.

ALGIERS.

## SHELLEY.

BY WILLIAM BRUNTON.

O for the bird-wing breasting ether fine,  
 Surveying earth a tiny speck beneath,  
 The curling of great seas in serpent-sheath,  
 Inlaid with emerald lands from line to line!—

O for the virgin lips of dew-steeped flower,  
 Whose perfumed heart with love delights the day!—  
 Or for the fairy lute of lark, whose lay  
 Disperses despondency, as sunshine shower!

Yet why beseech such god-blessed gifts of old,  
 When our Prometheus won their varied worth?—  
 His eagle flight was so, his mouth of gold,  
 His lyric melody of heaven's own birth:

His orbic nature each perfection stole;  
 He lived like lark with sweet Narcissus soul!

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXX.—Continued.

Ilse was again alone in the hall, looking sadly  
 at the strange walls. All the sorrow that had ever  
 moved a human soul in this room, jealousy and wounded  
 pride, feverish expectation and hopeless longing,

\* Translation copyrighted.

mourning over the destruction of happiness, and terror  
 for the future, the cries of anguish and the plaints of  
 tormented conscience, all these now awoke an indis-  
 tinct and trembling echo in the heart of the woman.

"It is strange and gloomy here, and if I try to ex-  
 press in words what distresses me, all power of expres-  
 sion fails me. I am no prisoner, and yet the air that  
 surrounds me is that of a dungeon. The Chamberlain  
 has not been near me for days, and the young Prince,  
 who used to speak to me as to a friend, comes seldom,  
 and then but for a few minutes, and it is worse than if  
 he were not here. He is as depressed as I am, and  
 looks at me as if he felt the same nameless anguish.  
 And his father? when he comes to me he is so kind  
 that one cannot but like him; but as soon as he turns  
 his back his features appear before my mind distorted.  
 It is not good to be near the great people of the world;  
 they seem to take a fancy to one and open their heart  
 as to friends, and one scarcely feels the elevation of  
 mind occasioned by this, when tormenting spirits seem  
 suddenly to draw them back into their invisible realm,  
 and one is troubled and excited about them. Such a  
 life is destructive of peace.

"Felix says, one ought not to care about these  
 frivolous people. How can one avoid interest and  
 anxiety about them when the welfare of their souls is  
 a blessing to all?

"Is it only this that gives you such restless thoughts,  
 Ilse?" she asked herself; "is it this, or is it pride, now  
 wounded, and now again flattered; or is it anguish  
 about the loved one whom she wishes secretly to tear  
 from you?

"Why am I so fearful about you, my Felix? Why  
 do I despair because he has found a woman here of  
 the same stamp of mind as his own? Am I not so also?  
 Have I too not unfolded in the light of his mind? I  
 am no longer the ignorant country-girl that he once  
 brought from among the herds. If I am deficient in  
 the attractive charm of the distinguished lady, what  
 can she give him more than I? He is no boy, and he  
 knows that every hour I live for him. I despise you,  
 miserable thoughts; how have you found entrance into  
 my soul? I am no prisoner within these walls, and if  
 I linger here where you have power over me, I remain  
 on his account. One should not forsake him whom  
 one loves,—that word was spoken for me also. My  
 father's child shall not cry and mourn even though her  
 loved one should be sitting with the Princess by the  
 hazel-bush."

\* \* \*

Gabriel was stealing along in a distant part of the  
 pleasure-ground. He suddenly felt a touch on his  
 shoulder; Prince Victor was standing behind him.

"Friend Gabriel?"

"At your Highness's commands."

"Where have you served?"

"With the Blue Hussars."

"Good," nodded the Prince; "we are in the same branch of the service. I hear you are a trustworthy fellow. But what is the matter with you?" He took out his purse. "We will share; take what you want."

Gabriel shook his head.

"Then the women are at fault," cried the Prince; "that is worse. Is she proud?"

Gabriel dissented.

"Is she faithless?"

The poor fellow turned away.

"I am, alas! a bad intercessor with parents," said the Prince, sympathizingly; "the race of fathers have little confidence in me. But if it is only a question of appealing to a girl's conscience, then depend upon me."

"I thank you for your good-will, Highness, but nothing can help me. I will have to fight it out alone."

He turned away again.

"Bah! comrade, have you forgotten the soldiers' saying: 'Like all, love one, grieve for none?' If your heart is heavy, you should not rove about as you do. In lack of another companion put up for the time with me."

"That is too much honor," said Gabriel, taking off his cap.

The Prince had during this conversation gradually led him into a thicket; he seated himself on the root of an old tree, and motioned Gabriel to the next trunk.

"We are in concealment here; you look out that way, I will watch this road, that no one can surprise us. How do your lodgings please you? Have you found pleasant acquaintances?"

"I think it prudent to trust no one here," answered Gabriel, cautiously.

"But I do not belong here; there is no reason why you should not make me an exception. You may assume that we belong to the same company, that we are sitting by the same fire, and drinking from the same flask. You are right: all is not so safe here as it looks. I do not like these nocturnal disturbances in the castle. Have you heard of them?"

Gabriel assented.

"In such an old castle," continued the Prince, "there are many doors that few know—perhaps also passages in the wall. Whether it is spirits or something else, who knows? It glides about and sometimes comes out when one least expects it; and just when one has put on one's night-shirt a secret door is opened, or a plank in the floor rises, and a cursed apparition floats up, removes what is on the table, and before one can bethink oneself, disappears again."

"Who can allow such a thing, your Highness?" replied Gabriel, valiantly.

"Who can be on his guard?" said the Prince, laugh-

ing; "it stretches out its hand, and one becomes immovable; it holds a sponge before the nose of the sleeper and he does not awake."

Gabriel listened attentively.

"People say that in the Pavilion all is not secure," continued the Prince. "It would be as well for a trusty man to make an examination in secret; and if an entrance should be found that is not regular it should be fastened with a screw or a bolt. It is indeed uncertain whether or not one may find such a thing, for such devil's work is slyly managed."

He nodded significantly to Gabriel, who stared at him in great astonishment.

"That is only a thought of mine," said the Prince; but when a soldier is in foreign quarters he looks after every security during the time that his people sleep."

"I understand all," replied Gabriel, in a low voice.

"One must not cause others unnecessary alarm," continued the Prince; "but in secret one may do one's duty like a brave man. I see you are that." The Prince rose from his seat. "If you should at any time need my help, or have anything to tell me which no one else should know, I have a fellow with a great moustache, a good, quiet man; make his acquaintance. For the rest, take care of yourselves here. There is a lackey who idles about near you; if there are any errands to do he can attend to them. It is a good thing for a family to have a trustworthy man at hand in a strange house. Good day, comrade, I hope I have changed the current of your thoughts."

He went away; Gabriel remained in deep thought. The bantering of the Prince had roused the honest man from his sorrow; he busied himself now about the house in the day-time, but in the evening, when his master and mistress were at the theatre, he was to be seen sometimes with the Prince's servant in confidential conversation on a garden bench.

The spirit of sad foreboding spread its grey veil over the walls of the Pavilion, but in the Sovereign's castle meanwhile an invisible hobgoblin of another kind was at work, disturbing great and small. The stable was in consternation. The Prince's favorite saddle-horse was a white Ivenacker. When in the morning the groom went to the horse, he found it with a large black heart painted on its chest. He could not wash out the scandalous mark, probably the evil spirit had in this prank employed a dye intended for the hair of man. Connoisseurs declared that only time could heal the injury. They could not help making it known to the Sovereign who was violently angry, and set the strictest investigations on foot. The night-watchers of the stable had seen no one, no stranger's foot had entered the place; only the groom of Prince Victor, a moustached foreigner, had, at the same time with the other stable servants, cleaned the horse that

he had lately received as a present from a relative. The man was examined, he spoke little German, was said by the other servants to be harmless and simple, and nothing could be learnt from him. Finally, the stable-boy who had kept watch was dismissed from service. He disappeared from the capital, and would have been reduced to great misery if Prince Victor had not provided for the poor wretch in his garrison.

There was a great uproar among the ballet-girls. In the new tragic ballet, "The Water Sprite," the first dancer, Guiseppa Scarletti, had a brilliant rôle, in which she was to wear green-silk trunks, with rich silver trimmings. When she was to put on this part of the costume, which was very important for the rôle, for the first representation, her assistant was so awkward as to hand it to her wrong side foremost. The lady expressed her displeasure strongly, the tire-woman turned it round, and it was still wrong. Upon nearer inspection of this piece of art, it was discovered, with dismay, that it presented two convex surfaces like the shell of a bivalve. Mademoiselle Scarletti broke out into a fury, and then into tears and finally hysterics; the manager and the intendand were called; the *artiste* declared that after this disgrace and disturbance she could not dance. It was not until Prince Victor, whom she highly esteemed, came into the dressing-room to express his deep indignation, and the Sovereign desired her to be told that the insult should be punished in the severest manner, that she recovered sufficient courage to play the difficult rôle. Meanwhile the fairy-like rapidity of the theatrical tailor had remedied the injury to her dress. She danced superbly, but with a sad expression that became her well. The intendand was already rejoicing that the misfortune had thus passed off, when suddenly, in the midst of the last scene, when the whole depth of the stage was disclosed, the exchanged trunks appeared under Bengal lights in the water nymph's grotto, hanging peacefully upon two projecting points of a silver rock, as if a water sprite had hung them up to dry. Upon this there was a disturbance, and loud laughter among the audience, and the curtain had to fall before the Bengal lights were extinguished. It all looked like revenge, but again the culprit could not be discovered.

The hair of all the servants stood on end. They knew that in the bad times of the princely house a black lady walked through the corridors and rooms, which portended misfortune to it. The belief in this was general; even the High Marshal shared in it; the black lady had appeared to his grandfather, when, on a lonely night, he was awaiting the return of his gracious master. One evening, after the Court had withdrawn, the Marshal was walking, with the lackey carrying a light before him, through the empty rooms to the wing in which Prince Victor lodged, in order to

smoke a cigar with him. Suddenly the lackey started back and pointed, trembling, to a corner. There stood the black figure, the head covered with a veil; she raised her hand threateningly, and disappeared through a door in the tapestry. The light fell out of the hand of the lackey, the Marshal groped in the dark to the ante-room of the Prince, and sank down on the sofa there. When the Prince entered from his dressing-room he found him in a state of the highest consternation: even a glass of punch, which he himself poured out, could not arouse him from his depression. The news that the black lady had appeared flew throughout the castle; an uneasy foreboding of evil occupied the Court. In the evening the lackeys ran hurriedly through the corridor, and were frightened at the echo of their own steps, and the Court ladies would not leave their rooms without escort. The Sovereign also heard of it; his brow contracted gloomily, and at dinner he looked contemptuously at the Marshal.

Even the Court ladies were not spared. Miss von Lossau, who lodged in a wing of the palace over the rooms of the Princess, returned to her apartment one night in the happiest frame of mind. Prince Victor had paid her marked attentions. He had been very amusing, and had shown a degree of feeling which he had never before evinced. Her maid undressed her, and she laid herself to rest with sweet and pleasant thoughts. All was quiet: she fell into her first sleep. The image of the Prince danced before her; then she heard a slight noise; there was a crackling; something moved slowly under her bed. She started; the mysterious noise ceased. She was on the point of deluding herself into the belief that it was a dream, when the noise was repeated under the bed, and something came clattering out. She heard an alarming sound, and saw by the faint light of the night-lamp that a ball was slowly pushing itself behind the chair, and stopping in front of the bed. Half unconscious from terror, she jumped out of bed, touched a strange-object with her naked foot, at once felt a sharp pain, and sank back with a scream. She now raised a loud cry for help, till her maid rushed in, and tremblingly lit the candle. The lady was still shrieking in a corner, where the prickly spectre-ball still lingered in quiet timidity, and gradually showed itself to be a great hedgehog, which was sitting there, still dreamy from its winter sleep, with tears on its nose. Miss Lossau became ill from fright. When the physician hastened to her the next morning, he found the lackeys and maid-servants collected in close conclave before her door. On the door was pasted a white placard, on which was to be read, in large characters, "Bettina von Lossau, Princely Court Spy." Again there was the strictest investigation, and again the culprit was not discovered.

(To be continued.)

## CORRESPONDENCE.

## MRS. M. M. E. ON MARRIAGE CONTRACTS.

To the Editor of THE OPEN COURT:—

A position which will not bear a thorough investigation is not worth defending, so I welcome the criticisms of Mrs. M. M. E., and of any one else who desires to take a hand. I think I can explain to the satisfaction of Mrs. M. M. E. some of the points she refers to.

I have not ignored the rights of others than the two principals in a case of separation of husband and wife, as Mrs. M. M. E. avers. I have insisted that the support of children should devolve on the father in such case, as in marriage. No matter where they might be, this rule would secure them from want at least, and leave the mother at liberty to support herself. Of course such law would be limited by the arrival at an age of self-support by children. This responsibility on the part of fathers is not only just, but it is natural. The man is primarily responsible for their existence, and if there is one form of responsibility more obligatory than another, it is this one. Support once secured, the chief obstacle to their finding a home away from the father, if that should be necessary, is removed. Remaining objections are trivial compared with the principal interests involved.

Mrs. M. M. E. further asserts that separation would fall more heavily on the woman than on the man. This would only be true in two of the five supposable cases, *i. e.*, where the man alone desires the separation, either from a good or from a bad woman. We will probably agree, that in the latter case the hardship is that which is found in the "way of the transgressor"; while in the former case many persons will agree with me that separation is the least of the two evils which confront the good woman whose husband wishes to leave her. If she is a good and congenial woman, the man who wishes to leave her must be an unworthy character. But that her "occupation is gone," as Mrs. M. M. E. declares, I deny; I should say that it was only opening with brighter prospects, and that her future would probably be far better than her past.

In my paper I did not devote more than a few lines to the question of support of the woman after separation. It is to my mind a self-evident proposition that an abandonment of the marriage relation between a man and woman, means an abandonment of all responsibilities growing out of that relation, so far as the principals are concerned. This is not only just from a business point of view (a view which I take with reluctance), but it is the only fair thing in its relation to marriage in general. The man will probably marry again, and his resources will be generally needed to support the new relation. He had certainly better devote his means to the support of a woman with whom he can live, than to that of one with whom he cannot live. A law requiring the support by the man of a woman from whom he is separated is unfair to the man and to some second woman, and is also unfair to society. It prevents the man from marrying, and so encourages irregularities; and it removes from the woman the necessity of adapting herself to the order of nature and of society, thus paying a premium for general cussedness. The advantage to be gained by bad women over the good under such an arrangement, is obvious. The law of absolute divorce, recognizing these facts, requires no financial consideration either way.

The question of the financial position of women in marriage has occupied a good deal of the thought of jurists. That a woman should be protected in her individual property rights is fair, in view of the risks arising from her possible marriage to a spendthrift. But it affords men an opportunity of escape from the payment of their debts, which results in a heavy tax on society. But some of the propositions which are put forth by certain agitators

on this subject are preposterous. It is argued that a married woman is entitled to half the profits arising from a man's business, since she has lived with him and kept "his" house, and borne and brought up "his" children, etc., during this period. But there is no real relation between the two orders of facts, except that the support of the family reduces a man's financial ability by the amount which he spends in that way. The support of a family is not profitable financially. It is very profitable morally, and is as much so to the woman as to the man. Both are benefited by the relation, and each pays for what they get. The man pays in support; the woman in the pains and labors of her occupation. Both are treated about equally by the arrangement, so that the man's business successes or failures are a matter quite apart. It is said that a man's financial ability is always good, but that a woman's capital is exhausted as years pass by. So be it. Her support is sure if she is married and no proposition has been made by which she can be separated from her husband after the first five years except by her own consent, or her own bad conduct.

This materialistic view of the subject is not congenial to the writer, but simply flows from the consideration of its dark side. The bright side, which should be uppermost in everyone's mind, shows that the sex-interest is strong enough to furnish all the inducements to mutual admiration and consideration, and that if other feelings arise it is due to the fact that this interest is not in a healthy condition. We are directed to the conclusion that the real remedy for woman's wrongs, and woman's rights as well, is to give every person as full an opportunity of finding their true "double," as the safety of society will permit. But no one will ever find that "double" who does not first acknowledge in their own minds the actual character of the relation as shown by the laws of Nature, which lie at the basis of all human institutions.

E. D. COPE.

PHILADELPHIA, January, 1889.

## NOTES.

We are in receipt of an interesting pamphlet by Edward Kibler, Esq., of Newark Ohio, entitled "Universality of two Temperaments."

The interesting essay, in the present number, entitled "Truth and Fiction," has been translated, with the sanction of Dr. Meyer from his work "*Kosmische Weltansichten*." Dr. M. Wilhelm Meyer is editor of *Himmel und Erde*, the astronomical journal recently started in Berlin.

The three latest publications of the Humboldt Library are reprints of: "Freedom in Science and Teaching," by Ernst Hæckel, with a preface by Prof. Huxley; "The Coming Slavery. The Sins of Legislators, and The Great Political Superstition," by Herbert Spencer; "Tropical Africa," by Henry Drummond. Price 15 Cents each. The Humboldt Publishing Company, 24 East Fourth Street, New York.

Dr. Edward Brooks of Philadelphia, the author of many excellent text-books on mathematics, mental philosophy, and kindred subjects, presents in his essay "Axioms the Basis of Mathematics" a criticism of our views as set forth in the editorial articles "Form and Formal Thought" (Nos. 64, 66, 67, and 69). Our answer "The Old and The New Mathematics" will appear in the issue of next week.

The opening article of the February *Century* is upon Gérôme,—chatty and instructive. The portraits of Mary, Queen of Scots, are interesting from the standpoint of the history of art. "Fairies and Druids of Ireland" appears in the series upon Erin, by Charles de Kay; the Ugrian element in the Irish race is discovered from the legends, annals, and traditions preserved in the history and folk-lore of the nation.

## SITUATION WANTED!

A gentleman (ex-professor in European College and with fifteen years' literary experience) desires a situation as private secretary or as director of studies in a case of neglected education. No objection to travel. Address, "Grammoukara," Office of this paper.

## LUCIFER THE LIGHT BEARER!

Holds to-day the Position of Advance Picket on the Danger Line of the Army of Aggressive and Progressive Journals. For more than two years it has been singled out for prosecution in the Courts by the enemies of Free Speech and Free Press.

Ninth year of Publication. Published weekly at Valley Falls, Kansas at one dollar and twenty-five cents per annum. Send twenty-five cents in stamps for a trial subscription of three months.

## PUBLICATIONS OF "THE OPEN COURT."

## The Marriage Problem.

By E. D. COPE, Ph.D.  
PRICE, 15 CENTS.

A scientific discussion, from a practical standpoint, of the question now engrossing the public attention.

## Three Introductory Lectures

—ON—

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1897.)

By F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

## THE IDEA OF GOD.

By PAUL CARUS, Ph.D.  
PRICE, 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God as an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Ethicism, the Monistic Conception of God.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,

5 Jordan Street,

Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

## Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition: Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecundation of Proto-Organisms.
6. Fecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Manget, Ribot, Haeckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kunt, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Mr. C. J. Romanes, that the first appearance of the various psychological and intellectual faculties is assignable to different stages in the scale of zoological development.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, Editor.

THE READER will find in *THE OPEN COURT* an earnest, and, as we believe, a successful effort to conciliate Religion with Science. The work is done with due reverence for the past and with full confidence in a higher future.

THE OPEN COURT unites the deliberation and prudence of conservatism with the radicalism of undaunted progress. While the merits of the old creeds are fully appreciated, their errors are not overlooked. The ultimate consequences of the most radical thought are accepted, but care is taken to avoid the faults of a one-sided view.

## THE QUINTESSENCE OF RELIGION

is shown to be a truth. It is a scientific truth (a reality) which has been and will remain the basis of ethics. The Quintessence of Religion contains all that is good and true, elevating and comforting in the old religions. Superstitious notions are recognized as mere accidental features of which Religion can be purified without harm to the properly religious spirit.

This idea is,

FEARLESSLY AND WITHOUT RESERVATION OF ANY KIND.

presented in its various scientific aspects and in its deep significance to intellectual and emotional life. If fully grasped it will be found to satisfy the yearnings of the heart as well as the requirements of the intellect.

Facts which seem to bear unfavorably on this solution of the religious problem are not shunned, but openly faced. Criticisms have been welcome, and will always receive due attention. The severest criticism, we trust, will serve only to elucidate the truth of the main idea propounded in *THE OPEN COURT*.

#### RATES OF ADVERTISING.

P. O. DRAWER F.

CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

EDWARD. C. HEGELER.

In No. 15, Mr. E. C. Hegeler explains his view of the soul. The soul, he says, is the form of a very complicated, self-acting mechanism of living substance; a part of its activity is accompanied with feeling; the feelings correspond in *form* to the most essential parts of the mechanism. The soul, as expressed by Bock, enters into our brain through the gateway of the senses. Reason is formed through the instrumentality of language. Noiré says: "Man thinks because he speaks." Immortality does not only mean the indestructibility of matter and energy but *soul preservation*. It implies not only continuance of life, but life in a special form. We can to a great extent renew ourselves by forming our soul in the growing generations through education and by example. To preserve and to elevate the *quality* of the human soul, that is the basis of ethics.

## WHEELBARROW.

"WHEELBARROW" speaks to the laboring men from the standpoint of a laborer, although he does not work with a shovel and wheelbarrow now. In his first essay, published in one of the early numbers of *THE OPEN COURT*, he says: "I sign my name 'Wheelbarrow' because that is the implement of my handicraft or was when I was a strong man. I was by profession a 'railroad man'; my part in the railroad business was making the road-bed by the aid of a pick, a shovel and a wheelbarrow." We quote this passage because from our personal acquaintance with "Wheelbarrow" we understand that it is literally true.

"Wheelbarrow" treats the labor question in a manner peculiarly his own, with illustrations drawn from every-day experience and presenting a moral which may be seen at a glance. He advises the working men in a friendly, persuasive way, and criticises many of their methods of reform as harmful to themselves, tyrannical and unwise. These essays have been much admired, not only by the working men, but also by men eminent in American literature. In an editorial article on "Wheelbarrow," the *Boston Herald* said: "He possesses in a striking degree the rare ability of being able to treat of complicated matters in so lucid and simple a manner as to make them easy of comprehension to those who have never before given the subject much thought. Last year he published a series of tracts on the labor question which were widely read, but not half so widely as they deserved to be. Treating of his subject from a working man's standpoint, he displayed an extraordinary wealth of apt but homely illustrations."

WHEELBARROW'S essays are contained in the following numbers of THE OPEN COURT:

PROF. R. D. COPE.

In Number 23 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the idealist to deny the existence of matter. The materialist behold the imperfection of the senses may pronounce them to be, one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

## A FLAW IN THE FOUNDATION OF GEOMETRY.\*

BY HERMANN GRASSMANN.

GEOMETRY, at the present day, still lacks a scientific beginning. The foundation on which the entire structure rests, suffers from a flaw that necessitates a complete reconstruction of the system.

In making an assertion such as the above, which threatens to overturn an edifice consecrated by the authority of centuries, it is incumbent upon me to support the same with the most conclusive kind of reasons.

The flaw, the presence of which I propose to show, is most easily recognizable in the concept of the plane. Taking the definition given in the systems of geometry with which I am acquainted, I find it to be assumed fundamentally therein, that a straight line which has two points in common with a plane falls wholly within the plane;—be it that this is tacitly accepted (as Euclid has done), or embraced in the definition of a plane, or propounded, finally, as a distinct axiom. The first case,—where the assumption is tacitly made,—is on its face unscientific; while the second, as I shall presently show, can with no more reason pretend to the requisites of scientific character.†

It is clear that the plane is already defined, be it as the aggregate of the parallel lines that can be drawn from a straight line in a direction not included in the latter, be it as the aggregate of straight lines that can be drawn from a point to a straight line. Adhering to the first definition now, it is clear that every straight line which cuts two of these parallels must also cut all the rest—a proposition not demonstrable without the assistance of a series of auxiliary propositions. If now a plane be defined as a surface which wholly contains all straight lines having two points in common with it, it is at once seen how, thus, the preceding proposition, hidden in this definition, has been smuggled into the domain of geometry; and just as little as any mathematician would permit an attempt to avoid the proof of the proposition that the opposite sides of parallelograms are of equal length, by defining a parallelogram as a quadrilateral whose opposite sides are equal and

parallel; no more are we to allow the proposition stated above to be improperly introduced into geometry by a definition, like that, of a plane.

The only remaining course, therefore, in case we wished to hold to the method of geometry hitherto pursued, would be to convert that proposition into an axiom. But if an axiom can be avoided without having to introduce a new one in its stead, it must be done; even though it should bring about a complete reconstruction of the whole science. For, in this way, the science must gain substantially in simplicity.

Proceeding now from this defect, which we trust we have shown, and going back still farther, to discover the causes of the same, we will find the latter to lie in the faulty conception taken of geometrical axioms. In the first place, it must strike the attention, that by the side of veritable axioms which set forth geometrical intuitions, entirely abstract propositions are frequently presented under the same name, as: "if two magnitudes are equal to the same magnitude, then they are equal to each other," and which, if by axioms assumed truths be understood, are by no means entitled to be thus named. In fact, I believe I have shown before (Sec. 1, Theory of Extension), that the abstract proposition just cited expresses only the idea of equality; and this holds good, also, of the other abstract propositions which point out substantially that what is produced in the same way from the same is itself the same [equal].

From the imputation of confounding axioms with assumed concepts Euclid himself, however, is free; Euclid incorporated the former among his postulates (*ἀρχήματα*), while he separated the latter as common concepts (*κοινὰ ἐννοιαί*)—a proceeding which even on the part of his commentators was no longer understood, and likewise with modern mathematicians, unfortunately for science, has met with little imitation. As a matter of fact, the abstract methods of mathematical science know no axioms at all; the initial proof, in these methods, is brought about by the combination of predications;† use being made of no other law of pro-

\* Translated by JPKK from *Die Ausdehnungs-Lehre von 1844 oder Die lineale Ausdehnungs-Lehre: ein neuer Zweig der Mathematik*, of Hermann Grassmann, pp. 32-37. Leipzig: 1878. Otto Wigand.

† As to the requisites of scientific character mentioned, see Grassmann's remarks at the close of editorial article, on page 1172 of this number.—TR.

\* It is quite possible, indeed, that an exposition exists, in which the defect alluded to upon has been avoided, without having come to my knowledge. But as the doctrines of parallels, that stumbling-block of mathematicians, would have had to have been cleared up in such an exposition, I could therefore assume with approximate certainty that no such exposition as yet exists.

† See p. 1370 of THE OPEN COURT, lines 11-23, first column.—TR.

gression than the universal one of logic that that which is predicated of a series of objects so as to apply to each separately, can be predicated in fact of each separate object belonging to that series. To set up this law of progression as an axiom, which, as we find, embraces merely an act of reflection upon what was intended to be said by the general proposition, can occur to no mathematician; this is done, improperly, in logic; and sometimes even, it is attempted to be proved in that science.

In geometry, therefore, only those truths are left as axioms, which are derived from the conception of space. These axioms, accordingly, will have been correctly reached, if when taken together, they afford the complete conception of space, and if, further, none be set forth which does not aid in completing this conception. Just here the true cause of the defective foundation of geometry in its present shape appears. Thus, on the one hand, axioms are overlooked that express primary conceptions of space, and which, afterwards, when their application is demanded, must be tacitly assumed; on the other, again, axioms are laid down, that express no fundamental conception of space, and which, consequently, upon closer examination, turn out to be superfluous; while, taken together, the axioms in general afford the impression of an aggregate of the clearest possible principles, arranged with a view to the easiest possible methods of proof.

The axioms of geometry, in the form we are compelled to assume them, state, rather, the fundamental properties of space as originally given to our representative faculty; viz., its simpleness and relative limitedness.

The simpleness of space is stated in the axiom:

1. "Space is in all places and in all directions constituted the same; i. e., in all places and in all directions the same constructions can be made."

This axiom, from its very form of expression, is separable into two axioms, of which one lays down the possibility of continued motion, and the other the possibility of a change of direction; viz.:

- II. 1. "Equality is conceivable with difference of place."
2. "Equality is conceivable with difference of direction, and particularly when the direction is reversed."

Let us call those constructions "equal and concurring" [like-running\*] which are made in exactly the same manner at different places, and thus are only distinguished with respect to place; those which are constructed in reversed directions in exactly the same manner, although in different places, "equal and con-

trary-running," in short, "reversed"; and those "exactly equal" which are different only with respect to place and direction. Adhering to these terms, further, to denote the results of the construction, we can express the above two axioms, with emphasis upon the subordinate clause of the second [II, 2], more simply thus:

- III. 1. "That which is formed by equal and concurring [like-running] constructions, is likewise equal and concurring."

2. "That which is formed by reversed constructions, is, in its turn, reversed."

3. "That which is formed by exactly the same [exactly equal] constructions (although at different places and from different initial directions) is in its turn exactly the same [exactly equal]."

The first two of these three axioms constitute the positive assumption of that part of geometry which answers to the first part of our science.

The relative limitedness of space is set forth in the axiom:

"Space is a system of third degree."

The immediate obviousness of these axioms\* and their indispensability must strike every person at once; without the first three [I, II, and III] there is no straight line, no plane, no angle possible; while the last sets forth space itself in its threefold extension. And although in the usual expositions they are for the most part passed over, yet it is not difficult to point to the places where they are tacitly employed. That they are adequate to the ends of geometry, can only be completely found out by the development of geometry from this germinal point.

#### THE DREAM-BEECH.

FROM THE GERMAN OF RICHARD LEANDER BY PHOK.

It is a hundred years or more ago since the lightning struck it and split it from top to bottom, and the plough now passes over the place where it grew. But in those days, upon the grassy knoll some few hundred paces from the first house of the village, a grand old beech-tree stood. And what a tree it was!—Such trees do not grow any more, for animals and people and plants and trees are all getting smaller and meaner every day. The country people used to say it came down from the time when the heathens lived in the

\* It may appear strange that the proposition is not taken here as an axiom, which states that between two points only one straight line is possible, or, as Euclid expresses it, that two straight lines cannot enclose a space ( $\gamma\epsilon\upsilon\sigma\iota\omicron\nu$ ). But this is contained in the first axiom, when correctly conceived; thus,—If two straight lines, which have one point in common, were to have still another point in common, then if the two lines did not at the same time have all other points in common and so completely coincided, the space at the second point mentioned would be quite differently constituted from what it was at the others. Should this proof, which moreover, would assume a stricter form in the actual development of the science, appear to hear too marked a philosophical stamp, we may nevertheless propound the proposition as a partial axiom for mathematical procedure, by merely keeping in mind its connection with the first axiom alone.

\* We adopt here more nearly the common way of conception, only substituting the more definite ideas of concurring [*gleichläufig*, like-running] and reversed [*gegenläufig*, contrary-running], for the concept parallel.

land; that a saint had been killed beneath the tree by the wicked men, and that its roots had drank of the holy blood, which ascended into the trunk and the branches and made it so great and strong. Who knows if it be true? But there was a great secret about the Beech. Everybody in the village, both great and small, knew *that*. Whoever fell asleep beneath it and had a dream—that dream was sure to come true. This was why it was called the Dream-Beech long before any one could remember, and nobody called it anything else. But there was something besides. Whoever lay down to sleep beneath the dream-tree durst not think of what he was going to dream. If he did, he dreamt of nothing but confusion and chaos that no sensible person could make anything out of at all. To be sure, it was a hard thing to do, because most people are altogether too curious for that, and so nearly everybody that tried it was sure to fail. Indeed, at the time when this story happened, I do not believe there was a single soul in the village, either man or woman, that had succeeded a single time. But all this about the dream-beech was true—that was certain.

One warm summer's day, when not a breath of air was stirring, a poor young apprentice came wandering along the high-road. It had gone hard with him for the many years he had passed among strangers, and as he came up to the village, he turned his pockets inside out to see what was left—but they were all empty. "What is to be done?" he thought to himself. "Worn out and weary; nobody will take you in, and 'fighting'—they have well called our struggle for bits of charity 'fighting'—that's a wearisome business." Just then he saw the lordly beech-tree on the grassy knoll before him, and as it stood but a few paces from the road, he threw himself upon the grass beneath it to rest himself a while. But the tree had a curious way of rustling, and as its branches swayed softly to and fro, there fell here and there through the leaves a ray of glittering sunshine, and here and there a particle of the blue sky beyond shone through upon him: his eye-lids drooped and he fell into a deep sleep.

The beech-tree dropped a branch with three leaflets, that fluttered and fell upon his breast. He dreamt that he sat in a cosy room at table, that the table was his and the room his and the house his too. A young woman stood before the table, resting her hands upon it and gazing kindly upon him, and that was his wife. And upon his knees he held a child which he was feeding porridge, and as the porridge was too hot, he was blowing into the spoon. His wife said: "What a fine nurse you'd make, dear!" and then she laughed at the idea. Another child, too, was jumping about the room, a stout, chubby-cheeked little fellow, with a big carrot on a string, which he

was chasing about and shouting at, as if it were a real, live fox. And both these children were his.—This was his dream, and it must have pleased him quite, for, as he slept, his whole face was covered with smiles.

When he awoke it was almost evening. The village shepherd with his sheep stood before him, quietly working at his net. He sprang up refreshed, stretched himself, looked about, and exclaimed "Kind heaven to him whose lot should be as this! 'Tis nice at least to know how it really would be." Then the shepherd approached him and asked him where he was going and whether he had ever heard about the tree. When he was convinced that he was as innocent as the babe unborn, he cried out: "You're a lucky fellow? I know you dreamt something good; I could see it on your face. Why, I was looking at you all the time you were asleep!" Then he told him what the story about the tree was: "Your dream will come true; that is just as sure as that this is a ewe and that a ram. Just ask the people at the village if what I say is not so. And now tell me what you dreamed!"

"Old fellow," replied the apprentice with a merry laugh, "that's the way they pump country-folk. I'm going to keep my dream to myself; you won't take that amiss surely. But depend upon it, nothing will come of it after all!"

He did not say this for the sake of saying it; he really meant it, for as he went toward the village he kept saying to himself: "Fiddle-faddle, shepherd's prattle! I'd like to know where the tree got the knack from."

From the gable of the third house as he came into the village, a long staff jutted out into the street; a gilded crown hung from it, and just beneath, in front of the door-way, stood mine host of the Golden Crown. He was in the best of humor, for he had just had supper, and had had quite enough, and that was the best time of day for him. The apprentice civilly doffed his cap and asked if he would keep him over night for a "God bless you."

The landlord looked at the trim young fellow in his dusty and torn clothes, eyeing him closely from top to toe. Then he nodded kindly and said: "Sit right down in the arbor there, near the door. May be there's a bit of bread and a jug of wine left over, and in the meantime they will make you a bed of straw." Whereupon he went into the house and told his daughter.

The daughter brought the bread and the wine, seated herself opposite him and had him tell her of the strange lands and things he had seen. And she told him, in turn, what she knew of the village-gossip, of the wheat-crop, that their neighbor's wife had had twins, and when the next village-dance was to take place at the Golden Crown.

Suddenly she sprang from her seat, and bending over the table to the apprentice, she said: "What are those three leaves there in your jacket?" The apprentice looked and found the branch with the three leaves; it had stuck fast to his jacket. "Oh, they must be off of the big beech-tree just outside the village," he said, "I took a little nap under it."

The maid listened eagerly and waited for him to say more. But he stopped; and then she artfully began to ask him all sorts of questions, till she found out for sure that he had slept under the Dream-Beech; and then she went around and around just like a kitten about a plate of hot milk, till she felt sure that he knew nothing of the wonderful power and virtue of the Dream-Beech; for he was an artful rogue and made out that he knew nothing about it.

When she had got that far, she arose and brought him another jug of wine, plied him to drink of it, and told him all sorts of things that she had dreamed and of what a great pity it was that none of them had ever come true.

In the meantime the shepherd came back from the pastures, and was driving his sheep through the village street. As he was passing the Golden Crown, and saw the maid sitting in the arbor and talking so earnestly with the apprentice, he stood still for a moment, and said: "Yes, he'll tell *you* all about his pretty dream of course, and I could not get a word from him." And at that he went his way with his sheep.

But the apprentice would tell the maid of nothing like a dream and she grew so curious that she could stand it no longer, and she straightway asked him what he had dreamt while he was asleep under the beech-tree.

Now the apprentice was an arrant rogue and his dream had made him mischievous and happy, so he puckers up his face, winks slyly with his eye, and says: "The beautiful dream that I had! It must be true. Yet I wouldn't dare to tell what it was." But she kept on urging and teasing him to tell, when he moved up quite close to her and said gravely: "I dreamed that I would marry the daughter of mine host of the Golden Crown, and that one day I would myself be the landlord here."

At first the maiden turned as white as chalk and then as red as a rose; she went into the house, but after a while she came again and asked him if he was in earnest and if he had really dreamed that.

"Why, of course!" he said, "and the one I saw in my dream was just the image of you." Again the maiden went into the house, but this time she did not come again. She went into her little room, and the thoughts poured over her heart as does the water over a river-weir; ever afresh and anew, on and on, as if the end would never come. "He does not know

about the tree. Wish as I may, it *must* come so; and nothing can help it." Thereupon she laid herself to rest and the whole night long she dreamed of the young apprentice. When she awoke the next morning, she knew his face by heart, for she had seen it so often in her sleep—and a trim fellow he was, there could be no doubt about that.

The apprentice had slept well and soundly upon his litter of straw; dream-beech and dream, everything he had said to the daughter of the landlord the evening before was long since forgotten. He was standing at the door of the tavern and was about to give his host his hand in parting. Just then the daughter entered, and as she saw him standing there ready to leave them, a strange feeling of dread came over her, a feeling as if she could not let him go. "Father," she said, "the wine has not been drawn off yet and the young fellow hasn't anything to do; if he would stay with us a day, he might earn his meals and a penny or two to help him on his way." The landlord of the Golden Crown had nothing to say against this, for he had just eaten a hearty breakfast and had had quite enough, and that was the best time of day for him.

But it was slow work with the wine. There was always this and that to be done, and the daughter always found something to bring the apprentice up from the cellar. When the great tun was empty and all the bottles filled, she said it would be just the thing for him to help in the fields a while; and when that was over with, there was all manner of things to be looked after in the garden—things that nobody had ever thought of before. And in this way week after week passed away, and every single night the maiden dreamed of the apprentice. In the evenings she would sit with him in the arbor before the house, and when he told of his mishaps and misfortunes among the strange peoples he had visited, a gnat or midge would always get into her eye and she would have to rub it out with the end of her apron.

A year had passed away, and the apprentice was still at the house of the landlord of the Golden Crown; everything was scoured and polished, white sand had been strewn upon the floors, and ever-green palm branches scattered about the house; the whole village was keeping holiday. For to-day the travelling apprentice was to marry the daughter of the landlord of the Golden Crown; and if any one, because of envy, did not rejoice in heart, he at least made everybody believe that he did.

\* \* \*

Not long after, as the landlord of the Golden Crown sat quietly smoking in his great arm-chair, he fell into a deep and peaceful sleep; and as he did not awake again, they came to rouse him. But his eyes had closed forever.

The young apprentice had to take charge of the inn, and really did become landlord as he had said in jest, and everything else turned out just as he had dreamed it under the old beech-tree. For the two children soon came, and I suppose he must have taken one of them in his lap some time or other and fed it, and blown into the spoon too, and of course the other one ran about the room with the carrot, although the man I got this story from, did not say that he did and I had really forgotten to ask him about it especially. But it must have been so, for everything that people dreamed of under the old beech-tree came out to a dot.

One day—it might have been four years after the day of the wedding—the young landlord of the Golden Crown was sitting in the public-room of the inn. His young wife came in and going up to him, said: "Just think, love; yesterday noon one of our harvest-men fell asleep under the Beech-Tree. Guess what he dreamed? He dreamed he was rolling in gold. And it was foolish old Caspar too, that everybody is so sorry for, and whom we keep only out of pity. What will he do with all his money?"

Then the husband laughed and said: "How can you believe all that silly nonsense? You are so sensible in other things. Just think for a moment whether a tree can know anything about what is going to happen, and if it be ever so old and so beautiful."

The wife looked at her husband aghast; then she shook her head and said gravely: "Husband, do not scoff. You should not jest about such things."

"I am not jesting, wife!" said the husband.

At that the wife was silent for awhile, as if she did not understand him quite, and then she said: "O, why do you say so! I should think you had every reason to be thankful to the blessed old tree. Has not everything come, as you dreamed it?"

When she said this, the husband made the pleasantest face in the world and replied: "God knows that I am thankful—thank Him and thee. It was indeed a pretty dream. It is as if it were but yesterday, so well do I remember it. And a thousand times more beautiful than in my dream has everything come out; and a thousand times more sweet and beautiful art thou, my love, than the wife I saw in my dream beneath the beech-tree."

Again the wife looked at her husband with open eyes as he went on: "But as to the tree and the dream I dreamt, my sweet one—why, surely it was nothing wonderful for me to dream once of happiness, when I had fared so ill among the strange peoples I had visited."

"But you dreamed that you would marry me though!"

"I never dreamed that! It was only a young woman

with two children that I saw, and she wasn't near so pretty as you are, nor the children either."

"Fie!" cried his wife. "Are you going to disown me, or the tree? Didn't you tell me the first day I saw you—it was in the evening out in the arbor—didn't you tell me you dreamt you would marry me, and one day become landlord of the Golden Crown?"

The husband thought, for the first time since, of the jest of that evening, and he said: "It can't be helped, dear wife! Really I didn't dream of you then; and when I said I did, it was only in jest. You were so inquisitive and I wanted to tease you."

His wife broke out into bitter tears and went out into the open air. After awhile he went after her. She was standing by the well in the court-yard and was weeping still. He tried to comfort her, but in vain.

"You have stolen my love and robbed me of my heart," said she. "I shall never again be happy."

Then he asked her if she did not love him, love him as she loved none other on earth, and whether they had not lived contentedly and happily together, as had none other in their village. She said yes to it all, but still she was as sad as before, despite all his comforting.

So he said to himself: "Let her have a good cry; other thoughts will come to her over night; she'll be the same as ever to-morrow." But he deceived himself; for on the morning after, his wife did not cry any more it is true, but she was solemn and sad, and tried to avoid her husband. It was of no use to try to comfort her; every attempt failed, as it did the evening before. The best part of the day she sat brooding in the corner, and started with fright if her husband approached her.

When this had lasted several days without any change whatever, a great sorrow took possession of him too, for he feared that he had lost the love of his wife forever. In silence he walked the house, thinking and thinking of what could be done, but nothing seemed to come to him. So one day at noon-tide he walked beyond the village and sauntered through the fields and meadows. It was a hot day in July; not a cloud in the skies. The ripened corn surged like an ocean of gold and the birds were singing merrily; but his heart was laden with sorrow. In the distance he could see the old beech-tree standing: like a monarch among trees, it towered high into the heavens. It seemed as if it were nodding to him with its great green branches, were calling to him as to a friend of long ago. He went and seated himself beneath it; and thought of the times that had passed. Five years had gone by since the poor apprentice had first rested beneath its branches and dreamed so wondrously. How beautiful! And the dream had lasted for five years—and now? All was over!—All over?—Forever?

The beech-tree began to rustle, as it had rustled five years before, and again it swayed its mighty boughs. And just as before, there fell here and there through the waving leaves rays of glittering sunshine, and here and there a particle of the blue sky beyond shone through upon him. His heart was quieted, and he fell asleep; for he had not slept for worry during the past few nights. And it was not long before he dreamt the dream of five years before; but now the wife at the table and the children playing about it were the dear familiar faces of his wife and his children. And his wife was looking at him so kindly—so kindly!

He awoke, but when he saw that it was only a dream, he grew sadder still. He broke off from the tree a little green branch, and went home, and placed it in the hymn-book.

The next day—it was Sunday—as his wife was about to go to church, the branch from the beech-tree fell out. At this her husband, who was standing near her, blushed, and stooping down to pick it up, he tried to stick it in his pocket. But the wife saw it and asked him what the leaf was.

"It is from the Dream-Beech; it wishes me kinder fortune than you do!" said the husband. "For yesterday, as I was sitting beneath it, I fell asleep. It wanted to comfort me; for I dreamed that you were again kind to me and had forgotten all. But it is not true! There is no virtue in the good old Beech. A great and beautiful tree it is, but of the future it knows nothing."

At that his wife stared upon him, and then the sunshine played in her face: "Husband, did you, did you really dream that?"

"Yes," he answered firmly, and she saw that it was the truth, for his face quivered in keeping back the tears.

"And I was really your wife?"

When he said yes to this too, the wife fell upon his neck and kissed him so often and so fervently that he could not resist her. "Now God be praised," she said, "for all is well again! I love you so, indeed I love you as you cannot know. And how I've suffered from the dread that God might not want me to love you and that perhaps He had wanted me to marry some other man! For you did steal my heart, you bad man, and you did cheat me a little. But now I know that it didn't do you any good, for it would have turned out so anyhow."

At this, she was silent a moment, and then she said again:

"But you will not say anything bad about the Dream-Beech again, will you?"

"No, never; I believe in it now. May be not the same way that you do, but just as firmly though. Trust me!"

"So let us fasten the branch in the front part of the hymn-book. We must not lose it."

#### THE OLD AND THE NEW MATHEMATICS.

IN mathematics, just as in all sciences and in religion, we have an orthodoxy sanctioned by the authority of many centuries. This orthodoxy represents a conception of things, which in the past, to some extent, has proved sufficient for our needs. It is presented in the most direct, and for its purpose therefore in the best method—namely in the shape of dogmatism. Thus matters are, we are told, and it suffices to know that they are so. Dr. Brooks says: "Shall we not be content and let 'well enough alone' and rest with absolute certainty on the deduction of the present system of geometry?"

The representatives of orthodoxy are opposed by a class of heretics, who claim that humanity would have progressed more rapidly but for the impediments of dogmatism. The ideas of dogmatism, they say, are fundamentally erroneous, and must be overturned. Room must be made for doubt. Humanity, up to the date of the appearance of heretical views, it is held, has been erring under the dominance of orthodoxy, and we must commence to live the life of mankind over again.

These heretics, tearing down and criticizing the old dogmatism, are by no means useless, or nefarious, or dangerous men, although they are very often looked upon as acting the rôle of Mephistopheles and although, as a rule, they exhaust their power in mere negations without being able to build anew. Voltaire said: "If God did not exist, we should invent him." Similarly we can say: "If the devil did not exist, we should invent him." "The spirits who deny" play a very important part in the household of nature.

"Man's aspiration flagging seeks too soon the level,  
Unqualified repose he learns to crave;  
Whence, willingly, the comrade him I gave  
Who works, excites, and must create as Devil."

The negative criticism of heresy leads the orthodox conception to a higher plane of development, not by tearing down, but by forcing us to remould it, to eliminate its errors, and thus to unify its tenets with the other facts of reality. If we really had to commence to live the life of humanity over again, we would again have to start with the old or a similar dogmatism, until we were sufficiently matured to enlarge our views to a broader conception, in which our former orthodoxy is not so much destroyed as outgrown.

Dr. Brooks represents the orthodox standpoint of mathematics. He dogmatically believes in the finality of mathematical axioms; he says: "To know how we know the axioms to be true would be equivalent to proving them to be true." But he does not believe that we can know this *how*. "There is no 'how,'" he says. \* \* We just know that they are true and tha

is the end of it. \* \* To prove a truth is to establish it by some other truth; but there are no truths back of or before these axiomatic truths which authenticate them. They are absolutely first truths, underived and self-existent, and as such are cognized by the mind."

This standpoint of orthodox dogmatism in mathematics may be called the intuitive method. In opposition to it John Stuart Mill proposes his heterodox views, which are best characterized as the empiricist method. Mr. Mill says in his *System of Logic* (2, V, Sec. 1):

"The points, lines, circles, and squares which any one has in his mind, are (I apprehend) simple copies of the points, lines, circles, and squares which he has known in his experience. The idea of a point I apprehend to be simply our idea of the *minimum visibile*, the smallest portion of surface which we can see. A line as defined by geometers is wholly inconceivable."

If Mr. Mill's empiricism were correct, mathematics would be an experimental science, like chemistry and the other natural sciences. There would be no difference between formal sciences and experimental sciences, and such things as necessity or necessary truths would be illusions. Mr. Mill accepts this consequence and tries to eliminate "necessity." He says:

"This character of necessity, ascribed to the truths of mathematics, and (with some reservations to be hereafter made) the peculiar certainty, attributed to them, is an illusion. \* \* \*

"When, therefore, it is affirmed that the conclusions of geometry are necessary truths, the necessity consists, in reality, only in this, that they correctly follow from the suppositions from which they are deduced. Those suppositions are so far from being necessary that they are not even true; they purposely depart, more or less widely, from the truth. The only sense in which necessity can be ascribed to the conclusions of any scientific investigation, is that of legitimately following from some assumption, which, by the conditions of the inquiry, is not to be questioned."

According to Mr. Mill, our mathematical conceptions "are not even true; they purposely depart, more or less widely, from the truth." They certainly would depart from the truth if mathematics were an experimental science, if mathematical lines were images of material lines, perhaps of lead-pencil lines, if mathematical points were truly a *minimum visibile*, etc. Mathematical concepts depart from the real diagrams which we draw for the purpose of assisting our mathematical imagination, but they do not, therefore, depart from the truth.

If Mr. Mill's theory were correct, if mathematics were not a creation of pure formal thought, invented for properly comprehending the laws of pure form, if it were based upon the inaccurate, unreal, and, therefore, untrue images of material points, lines, circles, planes, etc., we would have to remodel the whole science of mathematics so as to make our conceptions of points and lines and planes "true." But an experimental mathematics of that kind, it need not be said, would lose all its value, its certainty, and its ex-

actness. Indeed, as a system of purely formal laws, it would be "untrue"; for it would conflict with the principle of mathematical conceptions that limits the field of mathematics to pure forms and excludes from it any kind of material existence.

The basis of mathematics is pure formal thought. The pure form of a thing is the spacial relation of its parts among themselves. The pure form of a leaden ball is its globular shape. Mathematics, accordingly, deals with the laws of spacial relations purely, without taking into consideration anything else. All other qualities, especially those relating to matter and force, are rigidly excluded.

Dr. Brooks says: "Some things not only exist but their existence is a necessity. They exist independently of all conditions and are subject to no contingencies." Among these things, time, and space, and axiomatic truths are classed. The paper, he says, "has length, breadth, and thickness; length, breadth, and thickness are possible only in space, therefore space also exists."

Certainly space exists, but it does not exist of itself. It has no absolute existence. It exists as a property of reality, and our conception of space has been abstracted from reality. "Length, breadth, and thickness," we propose to say, "are space." If we say with Dr. Brooks, they "are possible only in space," the dualistic error is near at hand, that space is not a mere abstract idea representing the quality of extension abstracted from extended things, but that it is something existing of itself; something which is the condition of extension, which makes it possible that things can have length, breadth, and thickness.

Space being an abstract and not a thing of itself has been supposed by some philosophers to be a non-entity. Descartes says,\* that if that which is in a hollow vessel were taken out of it without anything to fill its place, the sides of the vessel, having nothing between them would be in contact. This is erroneous. Space is not a non-entity, but a real property of things. The spacial relation between two sides of a hollow vessel remains the same whether there is or is not any matter between them. If we could succeed in annihilating the whole world, all spacial relation would be destroyed with it. But let there be one atom only, or one given point, where in our imagination we may place ourselves, and we will therewith establish a possibility of motion in all directions, and the possibility of constructing in our imagination other points in different distances or relations: we would have space—not a part of space, but space entire. Space being the possibility of motion, is determined by measurable relations, in which existences or possible existences or points can be arranged. A part of

\* Princip. Phil. II. 19.

space, alone and absolute, can neither be created nor can it be annihilated; for space being of itself a mere possibility of relations, is always entire. Thus the minutest part of a parabola contains the law of the whole parabolic curve into infinity, and so with the slightest part of space the whole of space is determined.

The old orthodox view of mathematics takes its stand on axioms (such as "a straight line is the shortest distance between two points"), which are accepted as self-evident truths. Among the simplest mathematical theorems is one stating that "the corresponding angles of parallels cut by a straight line are equal." Since an exact proof of this theorem was impossible, it has found a place among the axioms, and is in our textbooks usually treated as such.

Some mathematicians, however, did not rest satisfied with this solution of the Gordian Knot in the fashion of Alexander, and attempted to develop a geometry in which the theorem of corresponding angles should not be accepted as an axiom. They succeeded in establishing a new kind of geometry which was different from Euclid's geometry. Two straight lines cannot inclose a space according to Euclid; but in the new geometry, two straightest lines, if sufficiently prolonged, can inclose a space. To distinguish them from Euclidian "straight lines," it has been proposed to call them "straightest lines," both (straight as well as straightest lines) being the shortest possible distance between two points.

This new geometry has been called that of curved space, and further investigations\* showed that there are two kinds of curvature, the positive and the negative. The positive may be represented as the convex surface of a globe and the negative as the concave surface of a hollow globe. The Euclidian theorems now appeared as special instances of this geometry. They can be considered as constructed in a plane the curvature of which is zero.

We learn from the attempts made in this direction that the mathematical axioms are by no means "absolutely first truths, undervived and self-evident." They depend upon the special condition that the space curvature is zero, which (however justified for practical purposes) has been tacitly assumed.

\* \* \*

We can generalize the concept space and consider the line as a space of one dimension, the plane as a space of two dimensions, and actual space as a space of three dimensions. It is impossible to form any intuitive conception of a space of four and, still less, of more than four dimensions. Nevertheless, we can abstract from dimensions altogether and conceive of such absolute space as 'Form, pure and simple.' In doing so we can lay down the laws which are equally valid for

all kinds of spaces, whether of three, or four, or  $n$  dimensions. Algebra, indeed, is an abstraction of that kind, and algebraic laws are equally valid whether their symbols indicate lines, or planes, or solid bodies, or other things, as for instance logical concepts.

The ultimate step which can be taken in this direction is that of establishing a "theory of pure forms," as has been done by Grassmann. Grassmann recognizes no axioms whatever. He builds his "system of pure forms in general" and finds that Euclid's geometry, as well as the actual space of three dimensions, are special cases only of innumerable other possibilities, the laws of which are all contained in his "theory of forms in general." What Euclid called axioms are a few characteristic features which can be derived from the supposition that plane geometry is a system of second degree. Far from being first, or absolute, or independent truths, the axioms depend upon this supposition, and are applicable only for cases where it is avowedly accepted or at least tacitly assumed.

Grassmann no longer stands alone in the position he has taken; he has found followers who more and more realize that he has been the pathfinder of a new and fertile field of mathematical investigation. The ultimate basis of mathematics is no longer the intuition of space but the conception of "abstract form in general." The apriority of the mathematical laws of actual space has to be limited to the extent, that we can know by experience only that actual space has three dimensions, and we have learned to consider the world-space as one actual instance among many theoretical possibilities: it is a formal system of third degree.

Actual space, abstracted from reality, is a quality of real things representing their relations, the relations of their parts, and the possible directions of their motion. But actual space, as we can ascertain by experience, is at the same time a system of third degree. As a system of third degree, it is a creation of our mind, it is purely formal thought, to which all the rigidity and universality of formal laws is attached. The sentence "space is a system of third degree," is as little tautological, or begging the question, as that the earth is a spheroid; and it is at the same time just as much a matter of experience. The laws of a system of third degree apply to actual space with the same necessity\* as the principles of mathematical geography apply to the earth.

\* \* \*

Dr. Brooks says: "Some truths are not only true, but they are necessarily true," and "the mind has the power of knowing that they are necessarily true."

That gunpowder explodes is true; but it is not necessarily true. In damp weather it may not explode; the explosion depends upon certain conditions. But if all the conditions upon which, according to our

\* We mention the names of Lobatschewsky, Bolyai, Gauss, and Riemann.

experience, the result is contingent are fulfilled, we assume that it will explode. It ought to and very likely it will; but must it necessarily explode? Certainly not! There may be one condition which in all former cases was always fulfilled without our knowing it. If this one condition were absent in an eventual experiment the usual result would *not* take place. The results of experimental sciences are never necessary in this rigid sense. Rigid necessity does not depend upon conditions; it is intrinsic and we must be able to verify it as a necessity; we must know why or how it is a necessity, not by intuition, but by proof.

All formal truths are rigid necessities. Propositions, as for instance  $2 \times 2 = 4$ , and  $(a + b)^2 = a^2 + 2ab + b^2$ , possess intrinsic truth; for they do not depend upon external conditions, and hold good everywhere and for all possible cases.

For the sake of distinction, the truths of purely formal thought are called *correct*, and the truths of a well-ascertained experience *real*. Correct, accordingly, signifies that which is true in a mere formal sense, and real (in this limited sense) signifies that which has a material existence. Mr. Mill, therefore, in the above quoted passage, should have said that the mathematical suppositions are not realities (*viz.*, realities in the limited sense). They are not material existences. But that is no reason for declaring that they depart from the truth. If they are but correct, they are true; they are true so far as their form is concerned. By correctness we cannot gain substantial knowledge of things, but the correctness of our formal thought alone can afford that necessity, by means of which any kind of truth is established. Without the assistance of arithmetic, mathematics, mechanics, and logic, scientific knowledge cannot be obtained.

The assumption of Dr. Brooks that there are necessary truths, of which the mind has the power of knowing by intuition that they are necessarily true, would lead us back to the conception of "innate ideas." If we are not bound to explain why or how certain ideas are true, there is no means of discriminating between inveterate or inherited errors, and genuine truths.

The existence of the material universe is by no means necessary; nor is it necessary that actual space has three dimensions. We can imagine that we did not exist and that the whole world did not exist; we can imagine that a world existed, the space of which would possess two dimensions. But we cannot think it possible that  $2 \times 2 = 5$ ; and we can positively understand why the laws of form in general must hold good under all conditions and in all possible worlds. If they were never realized in actual existences, they would nevertheless remain what they are—correct.

\* \* \*

In the province of mathematics we move in an at-

mosphere of abstract thought. The simplest mathematical conceptions are by no means so absolutely simple as they appear; they are simple only in comparison to other mathematical ideas, to definitions of, and theorems about, complex figures. A bright little boy of six years may have very clear conceptions as to dogs, horses, and even engines or other concrete things, but there is little probability of his understanding the meaning of a mathematical point. That simple idea is too complex for his immature comprehension.

Dr. Brooks says:

"A derivation of one truth from one or more other truths is called reasoning. \* \* \* All reasoning can be traced back to truths which cannot be derived from other truths, and hence are not the result of reasoning."

According to our view the basic conceptions of mathematics and the axioms so-called, are the result of reasoning. They are not first truths from which we start quite from the beginning; they are not self-evident in the sense that there are no truths back of or before them; but we acquire them after a long exercise in mental work only. They are based upon a well-directed and disciplined discrimination. This discrimination between form and matter, simple though it appears to us now, is most subtle, and its importance is invaluable. It enables us to construct systems of, and to evolve the laws pertaining to, formal thought. This discrimination between form and matter is, therefore, the commencement of a higher development; it makes scientific thought possible.

The correctness of formal knowledge was formerly based on axioms which had to be taken on faith. But as long as the certainty of axioms is based upon intuition, mathematics (and all other formal sciences) must appear to hover in the air and have no connection with the solid facts of reality. Mathematicians, it is true, rarely were inclined to foster mystic views (Cabalistic and Neoplatonic mathematicians are exceptions), and Dr. Brooks also repudiates any kind of mysticism. Nevertheless as long as a science is ultimately based on intuition, there is room for any degree of mysticism. Grassmann's broader conception of mathematics has made all mysticism impossible. He has taught us to dive down to the bottom of the problems, where we can understand the origin and whole growth of mathematics and where they are seen to be in connection with the other facts of reality.

\* \* \*

For our present purpose we are satisfied with having pointed out the connection which obtains between mathematics and the other facts of reality; but we may add for those interested in the philosophy of mathematics, that from Grassmann's standpoint the connection, also, that exists between the different mathematical theorems and solutions is more readily under-

stood. Hamilton's quaternions and the significance of imaginary quantities have been anticipated by Grassmann and appear in their connection with his system in a new light. Grassmann's method allows a survey of the whole field and thus gives to the student that easy freedom which a traveler feels who constantly keeps in sight the point towards which he is journeying, as well as the road on which he approaches it.

Grassmann says\*:

"Since both mathematics and philosophy are sciences in the strictest sense of the term, the methods employed in each must accordingly have something in common, which gives them their peculiar scientific character. Now, we give a scientific character to a method of treatment when the student, on the one hand, is of necessity led by it to the recognition of every single truth, and on the other hand is placed in a position wherefrom he is enabled, at every point in the development, to survey the course of further progress.

"The indispensableness of the first requirement, *viz.*, scientific rigidity, every one will admit. As to the second, the same remains a point that is not as yet sufficiently recognized by the majority of mathematicians. Demonstrations are frequently met with, where, unless the theorems were stated above them, one could never originally know what they were going to lead to; here, after one has followed every step, blindly and at haphazard, and ere one is aware of it, he at last suddenly arrives at the truth to be proven. A demonstration of this sort, perhaps, leaves nothing more to be desired in point of rigidity. But scientific it certainly is not. The second requisite is lacking—namely, the power of survey. A person, therefore, that goes through such a demonstration, does not attain to an untrammelled cognizance of the truth, but he remains—unless he afterwards, himself, acquires that survey—in entire dependence upon the particular method by which the truth was reached. And this feeling of constraint which is at any rate present during the act of reception, is very oppressive for him who is wont to think independently and unimpededly and who is accustomed to make his own by active self-effort all that he receives. If, however, at every point in the development, the student is put in a position to see at what he is aiming, he remains master of his material, he is no longer bound to the particular form of presentation, and his assimilation of what he attains becomes actual reproduction."

P. C.

### "THE MARRIAGE PROBLEM."

BY LOUIS BELROSE, JR.

Faith is the substance of things hoped for, the evidence of things not seen.—HEB. XI. 1.

Let us have faith. The substance of things hoped for  
Outlasts the shadow of the things not seen.  
Let us have faith. The Word the worlds were framed by  
Framed our ideals and will keep them clean.

Let us have faith. That Word, all hearts shall hear it.—  
For us the time is long, but time is short.—  
Let us have faith, and thereby, like the elders,  
Obtain for recompense a good report.

Let us have faith, despite the mind's invention,  
To hold the way that man and brute have trod.  
Let us have faith in their unfailing instinct  
Who made the virgin mother of a God.

\* Grassmann, "Die lineale Ausdehnungslehre, ein neuer Zweig der Mathematik," Introduction, page xxxi.

### SONNETS OF WINTER-TIDE.

MARY MORGAN (GOWAN LEA).

I.

THROUGH night's dark hours the snow fell, feathery light,  
Until at break of morn, afar and near,  
No leaflet is descried nor brooklet clear,  
So close the earth is wrapped in mantle white.  
Round yonder hill the snow-plough comes in sight,  
Disclosing where the high-road should appear,  
Tossing the white wreaths o'er the landscape drear,  
Like waves before a ship, to left and right,  
Symbolic picture of the march of mind—  
Agent invisible—which yet doth know  
Earth's proud wealth to dispose—philosophy  
And art, and poesy—what it shall find  
Upon its course as forward it may go,  
New vistas opening for humanity!

II.

"Death is perhaps the last superstition."—Heine.  
I READ the secret of the earth and air,  
Concealed—revealed—in frozen twig and leaf,  
As surely as in Spring-tide's blossom brief:—  
Death opens Life's door, alway, everywhere.  
The bud we call 'To-day,' fresh, fair, and sweet,  
Roots in dead Yesterday, and fades from view  
Yielding To-morrow—Mount of purple hue  
Whose peak aspires the highest heaven to greet.  
Decay and growth! A prophecy is each,  
One of the other, in unbroken chain.  
Distrustful human heart, how shalt thou reach  
The knowledge that they are but aspects twain  
Of the imperishable Substance—Life!  
This truth attained, O soul, shall end thy strife!  
MONTREAL, February 4, 1889.

### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXX.—Continued.

But the spirit of torment that had quartered itself under the roof of the castle did not confine its tricks to the Court and its household; it ventured to disturb the Professor also in his learned work.

Ilse was sitting alone, looking absent-mindedly at the pictures of Reynard the Fox, when the lackey threw open the door, announcing:

"His Highness, the Sovereign!"

The Sovereign glanced at the picture in the open book.

"So that is the view you take of our position. The satire of those pages is bitter, but they contain imperishable truth."

Ilse closed the book, coloring.

"The ill-behaved beasts are rude egotists; it is otherwise among men."

"Do you think so?" asked the Sovereign. "Those who have had experience with them will not judge so leniently. The two-legged animals that pursue their aims at the courts of princes are, for the most part, as reckless in their egotism, and as much inclined to

\* Translation copyrighted.

profess their attachment. It is not easy to restrain their pretensions."

"Amongst the bad there are surely some better, in whom good preponderates?" rejoined Ilse.

The Sovereign inclined his head civilly.

"He who has to watch all keenly feels the narrow-mindedness of every individual, for he must know where and how far he can place confidence. Such an observation of various natures, which is always seeking to separate the reality from the glitter, to sound the worth of different characters, and to retain for the observer superior judgment, sharpens the perception of the deficiencies of others. It is possible that we may sometimes judge too severely, while you, with your warm feeling, fall into the amiable weakness of viewing men in too favorable a light."

"My lot, then, is happier," exclaimed Ilse, looking at the Sovereign, with honest commiseration.

"It is sweeter and happier," said the latter with feeling, "to give one's self up without restraint to one's feelings, to associate innocently with a few whom one chooses freely, to avoid by slight effort the ill-disposed, and to open one's heart gladly, and without restraint, to those one loves. But he who is condemned to live in the cold atmosphere of business, struggling against countless interests which clash together, can only carry on this existence by surrounding his daily life with regulations which will at least preserve him from overwhelming burdens and annoyances, and compel the foxes and wolves to bend their stubborn heads. Such rules of Court and government are not perfect work; there will often be complaints against them. You, perhaps, may have had occasion to remark that the customs and etiquette of a Court are not without harshness; yet they are necessary, for it makes it easy to us to withdraw and keep within ourselves, and maintain a certain isolation, which helps us to preserve our inward freedom."

Ilse looked conscious.

"But believe me," continued the Sovereign, "we still are human beings; we would gladly give ourselves up to the impulse of the moment, and live without restraint with those whom we esteem. We must often sacrifice ourselves, and we experience moments when such sacrifices are very severe."

"But within the princely family itself these considerations do not apply," exclaimed Ilse. "The mutual intercourse of father and children, brothers and sisters,—these holy relations can never be disturbed."

A cloud came over the countenance of the Sovereign.

"Even they suffer in their exposed position. We do not live together; we see each other less alone, generally under the observation of others. Each has his special circle of interest, is influenced by those

about him, who perhaps diminish his confidence in his nearest relations. You know my son; he has all the qualifications of a good, open-hearted man, but you will have observed how suspicious and reserved he has become."

Ilse forgot all caution, and again felt a little proud of being a confidante.

"Forgive me," she explained; "I have never found that. He is only bashful, and sometimes a little awkward."

The Sovereign smiled.

"You lately expressed an opinion with reference to what would be advantageous for his future. That he should for a time become acquainted with the management of a large family estate; it would undoubtedly be good for him to learn the work of a country gentleman by experience. Besides this, he is not happy at Court."

Ilse nodded.

"Have you also remarked that?" asked the Sovereign.

"I will give good advice for my Prince," thought Ilse, "even if it is not quite agreeable to him. May I venture to say," she said aloud, "that this is the best time of all. For he must learn, your Highness, the spring tilling, which is in full operation, so there must be no delay."

The Sovereign was much pleased with this zeal.

"It will not be easy to find a place," he said.

"Perhaps your Highness has an estate in the neighborhood where there is a small manor-house."

"Then he could come often to the city," replied the Sovereign sharply.

"That would not do," continued Ilse, eagerly. "He must first thoroughly know the work of the people, and for that be constantly in the fields."

"I could not find a better adviser," said the Sovereign, in excellent humor. "There is nothing in the vicinity that will answer; I have thought, however, of your father's estate."

Ilse started with surprise.

"But our mode of life is not adapted for the accommodation of a prince," she replied with reserve. "No, gracious Sovereign, the domestic arrangements of our family would not be suitable to the pretensions of the young man. I say nothing of other considerations which formerly never occurred to me, and which have first come home to me here. Therefore, if I may speak what I feel, I am of opinion that this, for many reasons, will not answer."

"It was only a thought," replied the Sovereign, good-humoredly. "The object may perhaps be attained without encroaching upon your father. It has been my wish," he continued, with chivalrous politeness, "to give you and your father a public proof of

my esteem. I have special reasons for it." He looked significantly at Ilse, and she thought of the birthday of the Princess.

"I know the reason," she said softly.

The Sovereign drew his chair near.

"Your father has a large family?" he asked. "I have a vague recollection of having seen several rosy-cheeked boys about."

"They were my brothers," said Ilse, laughing; "they are handsome little fellows, gracious Sovereign, if I, as a sister, may praise them; they are at present somewhat uncouth, but good and clever. My Franz wrote to me only yesterday to beg me to greet your Highness for him. The little urchin thinks it is the right thing. Now, as I have the opportunity, I will show you the letter as he has written it; it is a stupid, childish message, but it comes from a good heart."

She felt in her pocket and brought forth a letter written in fair characters.

"See, your Highness, how well the child writes. But I must not show you the letter, for your Highness would find in it a confirmation of your opinion, that men have always selfish wishes in the background when they think of their princes. The poor boy also has his wish."

"Then let us have it," said the Sovereign.

Ilse showed him the letter; the Sovereign graciously took hold of the letter, and in doing so, his hand rested on hers.

"He is so barefaced as to ask your highness for an india-rubber ball. The ball is already bought."

She jumped up and brought a gigantic colored ball.

"This I shall send to him to-day, and I shall write to him that it is not seemly to beg of so great a personage. He is nine years old, but still very childish—your highness must forgive him."

Enchanted by this frank open-heartedness, the Sovereign said:

"Write to him, at the same time, that I wish to tell him he must endeavor to preserve through the dangerous paths of life the pure feeling and loyal spirit of his eldest sister. I also feel how great is the blessing of your character to all who have the happiness of breathing your atmosphere. In a course of life which is filled with harrowing impressions, in which hatred and suspicion take more from the peace of the soul than hours of repose can restore to it, I have still retained my susceptibility for the innocent freshness of a mind like yours. You give me genuine pleasure."

Again he laid his hand gently on hers; Ilse looked down confused at the praise of her dear Sovereign.

A hasty step approached; the Sovereign rose, and the Professor entered. He bowed to the Sovereign, and looked surprised at his wife.

"You are not ill?" he exclaimed. "Pardon, gra-

cious Sir, I came in great anxiety about my wife. A strange boy rang the bell at the Museum, and brought a message that I must go immediately to see my wife, as she was ill; fortunately it was a mistake."

"I am thankful for the error," replied the Sovereign, "as it gives me the opportunity of saying to you what I was intending to mention to Madame Werner; orders have been given at the stable that a carriage shall be ready for you at any hour that you wish to take a journey in the neighborhood to pursue your mysterious investigations."

He took leave graciously.

The Sovereign opened the window of his study; the air was sultry, the sun had been shining long upon the earth; now it had vanished, heavy clouds rolled themselves, like great shapeless porpoises, over the city and castle. The Sovereign fetched a deep breath, but the heavy, sultry air forced the smoke from the chimneys of the castle down to his window, enveloping his head like a great mist. He hastily opened the door of the gallery which led to the reception-rooms, and walked out. Against the walls hung a row of oil pictures, the portraits of beautiful ladies whom he had once favored with his attentions. His look strayed from one to the other; at the end of the row was an empty place; he stopped before it, and his fancy painted a picture with blonde hair, and a true-hearted, frank light in the eyes, more touching than any of the other faces.

"So late," he said, to himself. "It is the last place and the strongest feeling. They are fools who tell us that years make us indifferent. If I had come across her at the other end," he glanced back along the gallery, "at the beginning of my life, when I yet looked longingly at the roses on the cheeks of maidens and was touched by the song of hedge-sparrows, would such a woman then have preserved in me what I have lost forever? Useless thoughts of the past! I must in the present keep firm hold of what has come within the reach of my hand. She is indifferent about the weak youth; but she feels herself uneasy here, and if she tries to escape me I have no power to keep her back. I remain alone; daily the same wearisome faces, whose thoughts one knows before they are spoken, whose wishes one knows before they open their mouths, and whom one sees to be prepared with feigned feelings. Whatever wit or will they have works secretly against me; what I receive from them is only the artificial glitter of life. It is sad to be a master before whom living souls turn into machines, and year after year to open the lid and examine the works. I myself have made them," he said, jeeringly, "but I am weary of my work."

(To be continued.)

## BOOK REVIEWS.

THE COUNTRIES OF AUSTRIA-HUNGARY.\* Descriptive and Picturesque. CROATIA AND SLAVONIA, by Dr. Friedrich S. Krauss. BOSNIA AND HERZEGOVINA, by Dr. Moritz Heunes. Vienna: 1889. Karl Gräser.

The two little books, in German, above noted, are the fourteenth and fifteenth volumes of a highly interesting series of works upon the various peoples forming the body of the Austro-Hungarian monarchy. No one of the great nations of civilized Europe, perhaps, is less studied in our country than the checkered realm ruled over by the Hapsburg dynasty; yet no country, whether in its historical and political, or in its social and ethnical features, presents such a diversified and fascinating field for the student of universal history. Here the Orient and the Occident meet. The marks of the ancient world, of Byzantium and of Rome, still stand uneffaced by the side of the broken remnants of modern Ottoman civilization. Slave and Magyar, Teuton and Czech, rub uneasily together in this vast conglomerate of migrated nations. Austria-Hungary is the ground where opposite civilizations join and blend, and deserves, from a social and ethnological point of view, the same attention that its imposing dynastical career has met with from the student of political history.

The volume by Dr. Krauss is especially interesting. The civilization, literature, and folk-lore of the Croatian and Slavonian peoples are the result of unique historical and geographical influences. The customs and religious superstitions of the peasantry are survivals of different epochs and changes in the current of national life—a rich field of research for students of folk-lore. The descriptions of Dr. Krauss are remarkably comprehensive, when we regard the size of the little work. The author belongs to a distinguished Hebrew family of scholars in Central Europe. The work upon Bosnia and Herzegovina is similar in scope and plan to that upon Croatia and Slavonia, having the additional interest of treating a subject not so well-known, and engaging our attention more, perhaps, on account of the recent occupation of these little lands by the forces of the Austrian empire. The late Crown Prince Rudolph took a prominent part in the editing of this series.

μυρο.

TURGOT. *Léon Say*. Translated by Melville B. Anderson. A. C. McClurg & Co., Chicago.

This is the fifth volume in a series of works, of mingled critical and biographical order, on "The Great French Writers." M. Say's work is written with great sympathy and intelligence, and presents us with a portrait of one of the most interesting characters of the period of the French revolution, one who shared neither the wild hopes of its extreme advocates, nor the condemnatory opinions of more timorous and conservative minds. Turgot is generally described, even by those who admire and wish to do him entire justice, as a failure; his non-success as statesman and economist being ascribed to the troubled condition of the times which would not permit a restless and suspicious populace to accept any leader for a long period. M. Say wishes to make it clear that he does not look upon Turgot in this light, and would "treat him not as defeated but victorious," calling him the founder of our present political economy, meaning, as he says, the French, for it would be difficult to say just what that science is at present in this country, though we may agree with the writer, the present century, being one of industry and "the application of great scientific, geographical, economic discoveries to the development of labor and wealth." Turgot did great service to the general cause of social progress by his teachings respecting the worth of labor.

C. F. W.

\* Die Länder Oesterreich-Ungarn's in Wort und Bild. *Avantien und Slavonien, Bosnien und Herzegovina*.

DIE DEUTSCHEN VOLKSLIEDER UND MÄRCHEN. Zwei Vorträge von Karl Knortz. Zürich: 1889. Verlags-Magazin.

Karl Knortz, the well known German translator of American poetry, dedicates these two lectures on German popular songs to German-Americans who, he hopes, will be good American citizens but at the same time preserve and cherish the literary treasures of their fatherland. It is their mission, he says, to cling to the humanitarian ideals of their great poets. An appendix contains about twelve German translations of popular ballads of Yorkshire.

The *Art Amateur* for February is especially full of information of a technical character which must be very useful to young amateurs. Mr. Kellogg continues his letter to a young China painter, which are very full and suggestive, and there are four articles of interest to Amateur Photographers.

"My Note Book" has various entertaining bits, but the most striking is an anecdote of Verestchagin, who threw a packet of cigars presented to him into the sea, exclaiming, "I won't smoke. If we can get art and fashion arranged against this vile practice, there may be some hope of its overthrow, at least in polite circles."

Greta's Boston Art Notes are very lively and give such a tempting description of Bach Bay Park, that one is inclined to hire a buggy immediately to explore its beauties. It may be safe to wait until June to realize all its charms.

The Designs for this number are very pretty. The Moonlight Landscape is soft and pleasing, if not very strong, and the Fern Decoration for a Tea Service is quite worthy of reproduction.

A design of Lilies for a Border is original and well conventionalized, and the decoration of Barnacles for a fish plate is suggestive and appropriate, perhaps, if not altogether agreeable. The motto "First Fruits of them that Sleep," does not strike us as appropriate to the design of wheat sheaves, as farmers usually have to be up pretty early, to secure a good crop.

The Magazine sustains its well earned reputation and does a good work in directing the thoughts and studies of young America. We should be glad to see more solid historical and critical matter in it.

E. D. C.

## NOTES.

Brentano's have issued a new book entitled "Frederick Struther's Romance," by Albert Ulmann.

Prof. Felix Adler lectured at the Chicago Opera House, on Sunday last, upon "The Education of Children." Prof. Adler proposes the inductive method, leading from practical examples to higher principles.

The discussion between Col. Ingersoll, Frederick R. Coudert, and Gov. Stewart L. Woodford upon "The Limits of Toleration," held before the Nineteenth Century Club, will be published in the *Truth Seeker* of Feb. 16th.

"The Last Journal" of the late Lady Brassey will be published here at once by Longmans, Green & Co. It contains an account of the trip of the "Sunbeam" to India, Borneo, and Australia. The publishers have sought to make this one of the most sumptuous volumes of late years.

We have received from the publishing house of Hermann Riemann of Berlin, copies of several pamphlets in a series entitled "Allgemein-verständliche Naturwissenschaftliche Abhandlungen," essays on scientific subjects, in popular language. The treatise by Dr. V. Schlegel on "The So-called Four-dimensional Space" is thoughtful and suggestive.

"It is a matter of record," says Governor Oglesby, in his biennial message to the General Assembly of Illinois, "that the labors of the State Board of Health towards the prevention of epidemics of contagious and infectious diseases, have resulted in a saving of nearly \$3,500,000 to the people of the commonwealth in 1881 and 1882, when smallpox was epidemic."

## PUBLICATIONS OF "THE OPEN COURT."

## The Marriage Problem.

By E. D. COPE, Ph.D.  
PRICE, 15 CENTS.

A scientific discussion, from a practical standpoint, of the question now engrossing the public attention.

## Artificial Persons

A PHILOSOPHICAL VIEW OF THE  
LAW OF CORPORATIONS

BY  
CHARLES T. PALMER, B. L.  
Price, 15 Cents.

Three Introductory Lectures  
—ON—

## The Science of Thought.

(First published in THE OPEN COURT of June, July,  
and August, 1897.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

## Dreams, Sleep, Consciousness.

—A PSYCHOLOGICAL STUDY BY—

GEORGE M. GOULD, M. D.  
Price, 15 Cents.

## THE IDEA OF GOD.

By PAUL CARUS, Ph.D.  
PRICE, 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entelism, the Monistic Conception of God.

### NEW PUBLICATION.

THE  
**Psychic Life of Micro-Organisms**  
A STUDY IN EXPERIMENTAL PSYCHOLOGY  
By ALFRED BINET.

Translated from the French with the sanction of the Author. Treating of the following subjects:

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecundation of Proto-Organisms.
6. Fecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Clopper and Lachmann, Manass, Ribot, Hebel, Engelmann, Espinas, Pouquet, Weber, Pfeffer, Kunt, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Mr. G. J. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

## Summary of Recent Work of THE OPEN COURT.

## PSYCHOLOGY AND BIOLOGY.

- EXPERIMENTAL PSYCHOLOGY IN FRANCE. ALFRED BINET,.....No. 74.  
 DREAM, SLEEP, AND CONSCIOUSNESS. DR. GEORGE M. GOULD,.....Nos. 74 and 75.  
 THE CONDITIONS OF LIFE. PROF. WM. PREYER, No. 72.  
 BODY AND MIND; OR THE DATA OF MORAL PHYSIOLOGY. FELIX L. OSWALD, M. D.,...Nos. 72, 75, 78.

M. BINET'S entertaining sketch of the state of Experimental Psychology in France is the only direct and convenient source from which the reader can obtain a comprehensive idea of the contributions the author's country is making to this branch of mental science. The work of psychologists in France is distinguished by its almost exclusive bearing upon the pathological phases of psychological phenomena. The greatest successes of MM. Ribot, Richet, Charcot, and others, have been in treating the *diseases* of the mind.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The concluding essay upon "The Conditions of Life," by Prof. Preyer of Berlin, treats of some important distinctions of modern biology.

Dr. Oswald's papers, in the series "Body and Mind," abound in entertaining and apt illustrations cited in support of his principles of moral physiology.

## PHILOSOPHY.

- THE SELF-EVIDENT. DAVID NEWPORT.  
 THE UNIFICATION OF RELIGION AND PHILOSOPHY. M. C. O'BYRNE.  
 THE ASSAY OF ABSTRACT IDEAS. EDITOR.

FRIEND David Newport contributes to No. 73 of THE OPEN COURT a forcible article discussing "The Self-Evident." Mr. Newport's treatment is marked by a theological tendency, and the points wherein the philosophy of THE OPEN COURT differs from the theology of the author are touched upon in the editorial note, "The Assay of Abstract Ideas." Mr. O'Byrne's article, in the same number, is a scholarly sketch of principles whereon to base the unification of the truths of religion and philosophy.

- SENSATION AND MEMORY. EDITOR,.....No. 74.  
 COGNITION, KNOWLEDGE, AND TRUTH. EDITOR,.....No. 76.

In these two discussions, the conditions and processes by which we start from the bare excitations of the sensory world and attain to knowledge, are unfolded. Sensation is the primal condition of all knowledge; the products of sensation are preserved and transmitted as psychological forms; the physiological law of this retentive power is memory, from which source are evolved the different branches and varied forms of human thought.

- AXIOMS THE BASIS OF MATHEMATICS. DR. EDWARD BROOKS,.....No. 76.  
 THE OLD AND THE NEW MATHEMATICS. EDITOR, No. 77.  
 A FLAW IN THE FOUNDATION OF GEOMETRY.  
 HERMANN GRASSMANN,.....No. 77.

In No. 76, Dr. Edward Brooks of Philadelphia, takes excep-

tion to an editorial thesis that "mathematics is unfortunately constructed on axioms." To Dr. Brooks no other way of construction is possible. There exist "*first truths* or *axioms* which the mind has power to cognize," which are incapable of proof, and which every system, even though nominally rejecting them, nevertheless tacitly employs. The editorial answer to Dr. Brooks, in No. 77, is based upon the principles unfolded in the series of disquisitions on "Form and Formal Thought," in Nos. 64, 66, 67, and 69. Axioms so called are the *result* of reasoning, and not the basis of it; the laws of formal thought determine the correctness and necessity of a proposition; conformity, in every instance, with these laws alone makes a truth universal; the relations of actual, material space have thus universally coincided with the laws of a formal system of third degree, and hence the rigidity and finality of those relations. In the same number, a translation from Hermann Grassmann's "Theory of Extension" is presented; it contains the fundamental points of departure of the new geometry from the old. No English version of this epoch-making work exists. The discussion will greatly interest those who have given their attention to the philosophy of mathematics.

## SOCIOLOGY AND ECONOMICS.

- HENRY GEORGE AND LAND TAXATION. WHEELBARROW,.....No. 73.  
 SYMPTOMS OF SOCIAL DEGENERACY. MONCURE D. CONWAY,.....No. 74.  
 JIM THE INVENTOR. WHEELBARROW,.....No. 76.  
 A GENERATION WITHOUT PROSPECTS. MORRISON I. SWIFT,.....No. 72.

WHEELBARROW opposes Mr. Henry George and the doctrine of Land Taxation with proper regard for the truth contained in the distinguished economist's theories. Objection is mainly taken to the universal creative power which the advocates of Land Taxation claim for their remedy. In man's obedience to moral laws Wheelbarrow finds the only magic wherewith to change the face of society. In "Jim The Inventor" Wheelbarrow traces the tendency prevailing in every branch of human activity, to construct machines which "will run forever;" "perpetual motion" is the fallacy of many systems aiming to eradicate social evils. Criticisms of Wheelbarrow's position will soon appear.

"Symptoms of Social Degeneracy," Mr. Moncure D. Conway, finds to be not unfrequent even in American civilization. We are prone to emphasize the survivals of barbaric institutions in effete Europe, while overlooking the excrescences of our own body politic. Lynch-Law, literary piracy, corruption in administrative circles, are signs of the decay of an ethical system and the theology that protects it. Worst of all, these evils are not unaccompanied with attempts at palliation.

## ESSAYS AND CRITICISM.

- THE ETHICS OF ROBERT BURNS. GEN. M. M. TRUMBULL,.....No. 75.  
 TRUTH AND FICTION. M. WILHELM MEYER,.....No. 76.

"In ease, fire, and passion," says Allan Cunningham, "Burns was second to none but Shakespeare." "He might have added," says Gen. Trumbull, "that as a lyric poet, as a national song writer, he was not excelled nor equalled by Shakespeare, nor by any other poet that was ever born. Burns had the divine gift of music in such excellence that he could put in tune all the different instruments of the great orchestra of man and force them all to vibrate in harmony."

Dr. Meyer is the editor of the new and promising astronomical journal of Berlin, *Himmel und Erde*. His essay upon the part that imagination plays in the observation of meteorites, has been translated with his consent; it is a brilliant treatment of an original theme.

## MAKING BREAD DEAR.

BY WHEELBARROW.

A FEW days ago a friend lent me a copy of *The North American Review*, in order that I might read an article by Mr. Henry D. Lloyd, on "Making Bread Dear." In that article Mr. Lloyd shows me the intricate wheels, cogs, and pulleys of that ingenious machine by which a conspiracy of the "rich criminal classes" can increase the price of bread. As my muscle and bone have always been cheap, it is of critical importance to me that bread should be cheap also. As I have usually sold myself in the market for a dollar a day, and from that to a dollar and a half, it has been an essential condition of existence to me that the land around me should be fertile, the rain upon it copious, and the sunshine strong. I have prayed against the late frosts in the spring, and early frosts in the fall, so that the crops might be abundant, and provisions cheap. My prayers have generally been answered as to the crops, but flour has not been cheap, and for years I have been dodging the price of bread. Sometimes I would sneak behind potatoes, but they were perishable, and grew dear in the winter time; then I hid among corn, and a good retreat it was, but the children asked for sure enough bread—the Johnny cake was dry. In the winter time white beans have been my generous friends, and often they have helped me to evade the price of bread. All through the summer time, Nature, the bounteous mother, covers our share of the earth with a carpet of grain resplendent in green and gold, while bands of criminals are permitted by the laws to discount it and corner it, to bewitch it and bedevil it, that it may become costly and scarce to the workingman. The guilty profit goes to them, and with it they corrupt our laws in the very capitol where they are made.

While one gang of food gamblers raises the price of bread, another gang raises the price of meat, but this concerns me little, for little of it I get. Another gang raises the price of coal, another the price of oil, and another the price of matches with which I light my pipe. I am in the toils of monopolies that shave my wages down to "what the traffic will bear." I use the slang of capital, which in my case means the lowest point that flesh and blood can bear, and have strength enough left to shovel. When the wages

comes the monopolies lay tax and tribute on it, and scale a bit of unjust profit from whatever I have to buy. I am helpless. I cannot get even with any one. As I am the very mudsill of society, there is nobody below me that I can oppress in revenge. I cannot retaliate on anybody. If I try to skrimp the dirt, and wheel up a light load, the boss on the bank detects the short measure, and yells, "Fill up the 'barrow.'" Bread-earners by hard labor of every degree. We are the Hebrew Hercules, shorn, and in the hands of the Philistines; we make rare sport for their holiday, but the revelry of monopoly cannot last forever; the hair of Samson will grow again.

I am told that high prices indicate social prosperity, and that they are necessary in order to make high wages for me. I doubt that; I think it is untrue. For many years my wages has remained in figures much about the same, although its power in the market has varied a great deal. Sometimes it would buy a good many comforts, and at other times very few, although nominally it was about the same sum. Since I first worked with the wheelbarrow the population of the country has doubled, while the wealth of it has multiplied fourfold and more. Of that multiplied wealth I get no share at all. I know of it only from reading. I never felt its growth in the swelling of my wages. The increased cost of life I know by hard experience, but no proportionate recompense in higher wages has ever come to me. Relatively, indeed, I am sure my wages is less than it was, because the higher prices make it harder for me to live. Through the increased power of machinery an hour's human labor now produces twice or thrice as much as it did some thirty years ago, but I get no benefit from that; my hours of labor remain the same. I shall never again believe that high prices for everything is a good thing for me.

When I first went to railroading, my wages was a dollar a day; it is now from a dollar and a quarter to a dollar and a half. To say nothing of the increased wealth of the country, and the multiplied facilities for producing all the comforts of life, this raise of wages does not even correspond with the higher prices of food, fuel, rent, and clothes, to say nothing of a hundred other things. You may prove to me by what you call political economy, that I am wrong in this opin-

ion, but I can prove to you by my household economy that I have had no meat for dinner to-day, and in that I know that I am right. I have not capacity sufficient to learn the abstract principles of social science, and if I even had the genius, I am too tired to exercise it now. I learn by object lessons, like a child, and I know that the home of every laborer in Chicago is an object lesson, from which even our statesmen yet may learn that progress sometimes travels hand in hand with poverty. As I lay my touch upon the Titan wrist of labor, I feel in its pulsations, the resolution that they must be divorced, that the makers of progress shall enjoy a larger share of its beneficence, that the men who flinch not from the penalty "in the sweat of thy face shalt thou eat bread," must have the ration that their sweat has earned, and that not much longer will they be cheated out of the bread, after they have paid for it the full price demanded by the great Creator's law. As making bread dear is morally a crime, let us make it a crime by law; let us build new penitentiaries to accommodate those vermin of trade who make dear the food of the poor. They are the lineal descendants of the sordid Egyptian speculators who tried to corner all the corn in Egypt, because there was a famine in the land of Canaan.

It is an impious thing to arrest the bounty of the Creator on its way to the poor man's home. Men combine to reverse the commandment "Feed the hungry," they contrive by strategy to prevent the hungry from being fed. "We must make the five cent loaf a little smaller," said the bakers of Chicago a month or two ago, when a rich forester had successfully performed an operation on the "Board." "Or else we must reduce the weight of the pound loaf to fifteen ounces." Either way, it means a smaller ration for me. In defiance of this visible fact, I am assured by impossible algebra and much double rule of three, that I am getting richer every year by higher wages, and fatter by cheaper food. Statesmen of terrapin brain tell me that I cannot possibly be hungry, because the statistics prove the increasing fatness of the land. I once took a seat in the gallery of the United States Senate in order to hear the debate. In the arena below me was a club of millionaires. To my surprise I saw that they had lost the power of natural speech. They could not talk; they chinked, like dollars rustled in a bag. In metallic monotone they tolled me that of the joint product of labor and capital the share of labor was absolutely and relatively increasing, while the share of capital was relatively decreasing. When I ask for my dividends I am told that I can get them from the statistics. Meanwhile I hear the drone of the everlasting driving-wheel furnishing power to innumerable eccentrics whose province it is to make bread dear, and laborers cheap.

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XXXI.

### HEALTH AND DISEASE. (Continued.)

THE physiological influence of emotion presents phenomena which cannot always be traced to their proximate cause, however strongly their purpose may suggest their causal connection with certain laws of organic evolution. The *anæsthetic tendency* of mental excitement, for instance, has never been clearly explained, though its effect is perhaps the most remarkable fact in moral physiology. Under the influence of violent emotion, not trifling injuries only, but serious, and eventually perhaps fatal, wounds, have often failed to betray themselves by any conscious sense of pain, till incidental symptoms, or the remark of a bystander, called the wounded man's attention to a fact which his nerves, somehow or other, had omitted to announce. After the battle of Ostrolenka, Kosciusko was surprised to find himself crippled by a shot which he thought had only pierced his boot; and during a rough-and-tumble fight with a Mexican desperado a French sergeant of my acquaintance received two stabs with a dirk-knife that came within an inch of piercing his lung, but which in the excitement of the scuffle were not felt at all, or at least not in a way to suggest the fact of a bodily injury.

"I knew that he struck me more than once when I got him under," said my sergeant, "but I declare I never knew he had done me anything worse than tearing the trimmings of my jacket."

The almost superhuman pluck of certain prize-fighting animals,—bull-dogs and badgers, for instance,—may in reality be founded on a temporary insensibility to pain, and the evident advantages of that negative endowment suggest its development by the agency of natural selection. Individuals gifted with that faculty of emotional *anæsthesia*, were less likely to succumb to the terrors of a life and death struggle, and therefore more apt to prevail in that struggle for existence which in a state of nature is implied by the frequent necessity of contesting the physical superiority of sexual rivals or alien antagonists.

The invigorating tendency of certain passions may have been developed in a similar manner. The formidable and, indeed, quite abnormal strength of infuriated men is so well known that even an athlete will hesitate to try conclusions with an adversary under the influence of raging passions, and in such moments fury-inspired vigor has often accomplished feats which afterwards surprised even the hero of the exploit. "The saints *do* help a man in a desperate plight," said an old Creole planter, who had rescued his family from

the attack of a brutal negro. "I know my age too well to imagine that I could have knocked that brute down with my natural strength. Why, I had nothing in my hand but the knob of my riding whip, and no man in his senses would have backed me for a cent against a big ruffian of that sort; but when I heard my children shriek for help I found I could burst the locked door with one push and stun that brute with a single smash in the face. After he fell, I could not grab anything handier than my wife's smoothing iron, and he would have been up again and at me in the next minute, but I broke his skull at the first crack."

The same strength-sustaining influence of fury may explain the almost miraculous victories of small bodies of desperate men over large armies of better armed foes, as in the three murderous battles which the rustic avengers of John Huss gained against the iron-clad legions of his enemies, or in that still less expected defeat of an entire Russian army by a few hundred followers of the hero-prophet Shamyl. Religious frenzy has often produced a similar effect, and on any other theory only a miracle could explain the almost constant victories of the Saracens, who, in spite of the determined resistance of millions of better disciplined and physically superior opponents, succeeded in less than a century in extending their empire from the Ganges to the Bay of Biscay. The Semitic race would, indeed, seem to be specially susceptible to the physical exaltations of mental ecstasy, and the most curious of all historical illustrations of that influence is, perhaps, the result of the campaign by which King Sebastian of Portugal hoped to achieve an easy conquest over the dying Sultan of Morocco. When the crusaders landed at Sidi Kamat, Sultan Muley had already taken his last farewell of his children and friends, and was not expected to survive the end of that day; but at the news of the invasion the old warrior arose, as a corpse from a coffin, mounted a litter, and throughout the dust and heat of a fiercely contested battle, directed the evolution of his cavalry with the voice of a Stentor; but after the complete rout of the invaders sank back, as from a task accomplished, and died in the arms of his palanquin bearers.

Disease itself has been known to yield to the life-sustaining influence of strong emotions, and feeble women often rise from their sick-bed to alleviate the sufferings of a sick child, and for the time being seem almost proof against the influence of bodily fatigue. Emotional insomnia is a frequent concomitant of mental excitement; intense anxiety seeming to banish, not only sleep, but the very desire of sleep, as if instinct dreaded the consequences of dismissing the aid of any mental faculty in the crisis of impending danger, like a general keeping his troops under arms all night to meet the assault of an approaching enemy.

Impending perils, however, cease to banish sleep after the problem of averting such perils has once been recognized as clearly hopeless, and it is a curious fact that condemned murderers generally enjoy a long, deep sleep on the night before the day of their execution. "Some of them even regain their appetite," said a prison-official whom I questioned on that point. "As long as there is any chance of a commutation or a new trial a scent of hemp makes people half crazy with restlessness, though they do not all show it as plainly as old——, who would trot up and down his cell like a cat trying to find a loop-hole of escape. They will read through big stacks of newspapers in the hope of coming across an encouraging view of their case and get through their meals in a perfunctory, impatient sort of way, as if they hated to waste a moment's time on any matter not directly connected with the all-absorbing problem of dodging the noose. They will lie down after walking around till their legs begin to weaken, but they keep brooding, and at the slightest noise are up again and peeping for news. But the moment the last chance is clearly gone, there comes a change; they stop trotting and begin to look for pastimes and all the meals they can get; some of them, indeed, keep begging for liquor, and as the next best thing seem trying to *eat* themselves into a stupor. Others take to reading novels or prayer-books, according to their religious notions, but all of them get a faculty for sound sleep, at the very time you would suppose a nightmare of falling trap-doors would wake them every ten minutes."

Ill-treated children, under circumstances revealing no hope of delivery, acquire that same "faculty for sound sleep," and will doze away at every opportunity, as if under the influence of an instinctive desire to escape their misery by flight to the fairy-world of dream-land.

That tendency, moreover, may be nature's way of avoiding the alternative of exposing the vital organisms to the influence of protracted grief, for there can be no doubt that sorrow shortens life, and there is a curious suggestiveness in the expression which makes "mortification" a synonym of disappointment. Success, on the other hand, grants a new lease of existence, and very long lives (as long reigns) have generally been cheered by a preponderance of gratifications over bereavements, while the recollection of cruel misfortunes is as often cut short by the merciful intercession of an early death. The reign of the first emperor of re-united Germany was as remarkable for its length as for the number of its triumphs, while there is an equally unmistakable connection between the disappointments and the premature death of Czar Nicholas I., Joseph II., and Napoleon III. The first Napoleon, with all his disregard of personal hygiene, was un-

questionably a man of prodigious vitality, and under less untoward circumstances would probably have outlived all his long-lived brothers.

A comparative study of the lives of centenarians, show, however, that with few exceptions the life-prolonging conditions seem to have included an exemption from all violent emotions whatever, and it must be admitted that the unequivocal cases of life-shortening sorrows are far more frequent than those of death-postponing joys, and the exceptional luck of the most fortunate may in that respect be possibly limited to the absence of cruel afflictions. "Le bonheur n'est qu'un rêve," says Voltaire, "et la bonheur est réelle," and happiness, in its most enduring forms, is, indeed, a mere negative boon—the absence of pain. And since that immunity has, without doubt, characterized the golden age of the *Juventus Mundi*, the era of patriarchal institutions and simple, nature-abiding habits, there is no reason for doubting the records of longevity during the pastoral and agricultural period of the Mediterranean nations—even without taking into account a large number of more directly health-destroying influences of our present modes of life; though from a different standpoint of eudemonism we might find a precarious consolation in the reflection that existence has gained enough in point of intensity to compensate the loss of chronological extent.

In one sense, however, the latter view would be even an understatement of the whole truth: Excitement, by the conflicting emotions of joy and grief, nay, with a decided preponderance of distress, could hardly be less conducive to health and longevity than the soul-stifling, mind-crushing tedium of our Sabbatarian Quaker-life. The joy-hating antinaturalism of our world-renouncing moralists has, indeed, done more to make existence a burden, and death a welcome gate of escape, than all the natural evils of existence taken together; and slaves, groaning under the yoke of an inhuman taskmaster, but sustained by the hope of compensation in the sports of a free weekly holiday, would have a better chance to bear up under the weight of affliction than the Pariahs of our so-called civilization, to whom life offers nothing but sleep—or the Lethe of intoxication—as the only reward for the endurance of lifelong drudgery. Even where outraged Nature fails to revenge herself in secret vice, the sources of vitality fail under the influence of a resignation akin to the withering of a plant deprived of sunlight and warmth; and the doctrine of the Buddhist fanatics who considered life a disease, has been almost justified by the consequences of the attempt to enforce their worship of sorrow.

The alleged injurious effects of excessive joy are mostly confined to cases where a previous tension of moral or mental energies, under the influence of in-

tense anxiety, was too suddenly relaxed by an unexpected propitious turn of affairs; though it is true that the weakness of extreme old age or a far-gone stage of certain organic disorders can make violent excitement of any kind as fatal as violent motion might prove to a person subject to heart-disease. A few weeks ago the international press mentioned the case of a poor German widow, who died in the arms of a son who had just returned from America and hoped to make his sudden arrival a joyful surprise to a family who had long mourned him for dead; and the presence of several hundred thousand spectators seems to leave no doubt in the truth of that famous episode in the history of the Olympic festivals, when old Diagoras, the Rhodian, sank down dead in the moment when the shout of an assembled nation greeted the announcement that his two sons had won the entire *pentathlon*, i. e., carried off the five prizes for which the Grecian athletes of Europe and Western Asia had been training for four years.

A more remarkable, if well established case, would be the story of the Moslem hero who had risen by personal bravery to ever prouder heights of military renown, but who died from emotion, in the flower of his youth, on receipt of his promotion to the supreme command of an army gathered for the conquest of Armenia. Such at least is the account of contemporary chroniclers, though subsequent historians incline to the view which traces the tradition to a fiction of the Caliph Walid, whose jealousy had encompassed the death of his ablest lieutenant—probably by the same means by which the despot Tiberius contrived to terminate the career of his popular kinsman.

#### MONISM AS THE FORMAL PRINCIPLE OF COGNITION.

The very nature of cognition, we have learned,\* is unification, and through cognition our percepts, our concrete concepts, and our abstract ideas arrange themselves into a unitary system of knowledge. We cannot help searching for a unitary conception of the different phenomena, and our mind will never be at ease unless we, at least, feel convinced that we have found it. The disposition of our mind must thus naturally lead us to a monistic philosophy which attempts to understand all the single phenomena of the universe, as well as the whole of reality, by one universal law or from one all-embracing principle.

The constitution of the human mind, in this way, predisposes man for monism. The want of a unification of knowledge is the *subjective* condition out of which monism originates, but in itself it would have no value if it were not justified by experience. We can construct a monism *a priori* by pure reason, but must ratify it *a posteriori* through scientific investiga-

\* See the Editorial "Cognition, Knowledge, and Truth," in No. 76.

tion. The *objective* condition of monism is founded in the character of our actual experiences. All the natural phenomena which ever came within the grasp of human apprehension, were such as conformed directly or at least showed a possibility (if they were but better known) of conforming, by and by, to a unitary law. The regularity of the course of nature, and the rigidity of natural laws indicating their irrefragable universality, are the objective arguments in favor of the oneness of the All, as assumed by monism. The more science has progressed, the more has this truth of the oneness of nature been corroborated, and we cannot doubt but that it will be more and more confirmed. It is a *κρηκη ἐς ἀέλ*—an intellectual possession of humanity that has come to stay for good.

It will easily be understood that the oneness of nature (the regularity which pervades the universe and which can be formulated in natural laws—*die Gesetzmässigkeit der Natur*), must be considered as the ground of, or ultimate *raison d'être* for, the principle of oneness which is found in our mind. Our cognition, with the help of sensation, only mirrors in our consciousness the phenomena of nature in their regularity; so that knowledge in its entirety must become a systematic representation of the world in our brain.

Knowledge is not a useless efflorescence of the mind, as has been supposed by some one-sided idealists; nor does it exist for its own sake simply; it serves the very practical purpose of orientation in this world. So far as our knowledge reaches, thus far do we intellectually own nature, and can hope to rule its course in the interest of humanity by accommodating ourselves and natural events to nature's unalterable laws.

The unitary conception of the world has become a postulate of science. Indeed the single sciences, each one in its province, have always worked out and endeavored to verify the principles of monism. Every fact which seems to contradict the principle of unity must be, and indeed it is, considered as a problem until it conforms to it. As soon as it is found to be in unison with all the other facts the problem is solved.

Monism, being equivalent to consistency, is that view to realize which almost every philosopher aspires. Dualists, from principle, are inconsistent thinkers; yet even they attempt to construct at least a sham unity of their systems. Thus, supernaturalists look upon matter as a product of mind and materialists, vice versa, upon mind as a product of matter. The latter believe that life was created by dead matter, and the former that an extramundane God, the principle of life, created matter. They cannot help striving after a monistic view of the world; for the unification of all knowledge is the inherent principle of cognition.

Dualism appears to be a state of transition. It

emerges from the more chaotic state of many single unifications of knowledge, that were systematized under two opposite and apparently contradictory principles. Plutarch says in his book, *De Iside et Osiride*, chap. 45:

"The world is neither thrown about by wild chance without intelligence, reason, and guidance, nor is it dominated and directed by one rational being with a rudder or with gentle and easy reins as it were; but on the contrary, there are in it several different things, and those made up of bad as well as good; or rather (to speak more plainly) Nature produces nothing here but what is mixed and tempered. There is not, as it were, one store-keeper, who out of two different casks dispenses to us human affairs adulterated and mixed together,\* as a landlord doth his liquors; but by reason of two contrary origins and opposite powers—whereof the one leads to the right hand and in a direct line, and the other turns to the contrary hand and goes athwart—both human life is mixed, and the world (if not all, yet that part which is about the earth and below the moon) is become very unequal and various, and liable to all manner of changes. For if nothing can come without a cause, and if a good thing cannot afford a cause of evil, Nature then must certainly have a peculiar source and origin of evil as well as of good."

Good and evil, light and darkness, heat and cold, appear, at first sight only, as contradictory principles. As soon as we grow more familiar with the facts which we comprehend by these names, and when we attempt to reduce them to exact expressions by measuring their degrees, we perceive that, in reality, they are one and the same principle which can be viewed from opposite standpoints. After the invention of the thermometer the dualism of heat and cold was abolished forever, and a monistic view is firmly established on the basis of exact data, expressed in figures. Every dualism is, upon principle, an inconsistency of thought; but it will peacefully die away as soon as the illogical character of its inconsistency is discovered.

Monism is different from the other philosophical views in so far as it is not so much a finished system, but a plan for a system. It admits of constant realization and further perfection, in all the many branches of knowledge. The plan, however, can be sketched in outline and we need not fear of its being overthrown by unexpected discoveries. Other systems, as a rule, set out with objective principles to which their upholders try to adjust the facts of reality. Some hypothesis is formed and facts are interpreted by this hypothesis. Monism, however, is a subjective principle, a rule informing us how to unify knowledge out of our experiences, a plan how to proceed in building our conception of world and life from facts. We need fear no collision between our pet theories and facts, for it is a matter of principle that we have to take our stand on facts.

P. C.

\*Plutarch alludes to Homer, who feigns Jupiter to have in his house two differing jars, the one filled with good things, and the other with bad. See II. XXIV. 527.

AUGUST 15th, 1875.

BY LOUIS BELROSE, JR.

i.

I NE'ER had seen the moonlit summer night  
 More beautiful; above, the stars were drowned  
 In brightness, and below upon the ground  
 A distant haze blent all in one delight.  
 Along the stream a line of denser white  
 Lay heavily; and nearer, stretched around,  
 The wood stood still and slept without a sound;  
 While Time's swift wing beat on in silent flight.  
 No change; alas, no change, but all as fair  
 And tranquil as the placid sleep of faith,  
 And in my poor worn heart—despair, despair!  
 No change,—and all my hope was changed to death:  
 For I had heard upon the midnight air  
 Life's saddest sound,—a mother's dying breath.

ii.

GONE, gone! The gentle heart that unshdud  
 Could cheer us in the gloom of death's delay  
 Would throb no more: the hand that yesterday  
 Still answered mine; the lids so often dew'd  
 With tears by me; the lips that e'er renewed  
 Forgiveness—gone! Gone the last chance to pay  
 Love with fair deeds: and left to comfort me—  
 The memory of my own ingratitude.  
 O misery!—ab, could I but deceive  
 My sorrow with a little hope; but he  
 Like them that shut their eyelids and believe.

Relentless Truth, look what I bear for thee!—  
 They talk of grief that never learned to grieve;  
 And yet they say we doubt from vanity!

## CORRESPONDENCE.

### INEQUALITY IN MARRIAGE.

To the Editor of THE OPEN COURT:—

I CANNOT refrain from the desire to say a few words in regard to this question of the "Marriage Problem."

The question seems to be, how either or both parties to this most serious of contracts can most *conveniently* be released from the obligations which marriage imposes upon men and women equally—not how best to secure the fulfillment of these obligations. As an experiment limited to five years, I should judge marriage would become an institution from which thoughtful men and women would shrink. As a business arrangement, it is an impossibility because the junior partners cannot be consulted until they arrive, and, as it is unjust to act without taking the whole firm into consideration, the contract cannot be made with a settled *business-like* basis. That the dissolving of the marriage contract is always an unequal matter is clear. "Being married" naturally becomes the business of a woman as soon as she enters into this relation—therefore in case of separation, she is, so to say, "out of occupation" until she either learns a new way of life or marries again—while, as Prof. Cope very truly says, "a man's business success or failures are a thing quite apart" (from his household interests). A matter few take into consideration is also to be thought of. The *ease and irregularity* of a woman's life in a household unfits her greatly for what is required of her as a self-supporting member of the community, and totally unfits her for a return to the natural discipline of the paternal home. Now, I know I have raised a storm, but I crave your patience, my countrywomen! Women have a fancy to regard themselves as "the great army of martyrs," and

I doubt not many of them have much to suffer in the course of their lives—but let us look over the hardships of most married women's lives.—

Housework is a hard task for most women because they decline to learn how to do it, or to exercise it, until forced upon them by marriage. Childbearing is a burden because few women accept rationally and solemnly the position of a prospective mother, or try to suit their lives to the obvious inconveniences as nature intended they should—their sufferings are the tokens of their errors in judgment and behavior. The care of "bringing up" a family is supposed to be the rock on which most of our women are finally wrecked. If women would make more effort to bring up children instead of tyrants there would be less worry and hard work—possibly less occasion for considering the marriage problem.

Still, in spite of being desperately her own enemy, woman enjoys more ease and leisure under nearly all domestic circumstances than men do in their occupations and that does not give her the discipline needed to make an obedient servant—a patient workwoman or a strict attendant to stroke of bell or office-clock—if called upon suddenly to leave her home and take up such occupation. This accounts largely for the "failures" of apparently very capable women when called out of home life to self-supporting efforts; in consideration of this, I think I am justified in saying that the position of the principals in a marriage dissolution is an unequal one. Another thing which makes the matter unequal is that marriage with a man is the happy luxury which his success in the business of life permits him to indulge in, while with women marriage is the business of life through which she expects to attain to happiness and luxury. Therefore, although I fully coincide with Prof. Cope in his remarks on this point, I find the woman's plea for support, on being repudiated, justly or not, in a measure excusable, however lacking in logic or justice.

Discussion of this question of the best methods in a fully unbiassed spirit is a difficult matter, because it is a matter that touches us all more or less nearly. The remedy for "woman's wrongs and rights," suggested by Prof. Cope, is very wisely clausd! I think women will generally find themselves in the right and without wrongs wherever they accept their position in marriage naturally as *rational beings* with duties in life and obligations as sharply defined and as binding as those laid by Natural Law and Society upon men. However antiquated the opinion may sound I venture it: I believe a careful study and acceptance of the sentiments set forth in Katherine's speech (in *The Taming of the Shrew*, Act V. Scene II.) might help many a woman to solve her vexed marriage problem. I might add—the delicate courtesy toward women expressed in Prof. Cope's writing indicates how strongly consideration for women brings out the gracious qualities in man and assures us that she will be more leniently treated than perhaps she desires in the consideration of this knotty problem.

We are the children of our times and must accept patiently the movements of our times. Marriage like all our institutions must take its turn in going through the great mill that is grinding us out of old ways into new ones, and the grinding will go on until only the good grain is left and the chaff blown away—the noise of this grinding and the woefulness of its work is alarming and we naturally hasten to devise means of going to the rescue. To refrain from such effort would be to deny our humanity. The most sacred things are getting caught in this mill. Therefore our lance-breaking—therefore our OPEN COURT.—Meanwhile the re- and e-volutions will go on and end in the "selection and survival of the fittest," not only of individuals but of institutions. ZEKANAH.

### THE MATRIARCHATE.

To the Editor of THE OPEN COURT:—

I wish to make a slight correction of the statement of Prof. E. D. Cope in THE OPEN COURT of Dec. 27, in reference to Ma-

triarchy, which he declares "was simply a prostitution," under which "female infanticide was practiced and a system established which has its legitimate successor in the prostitution of modern ages."

All this is a mistake. Matriarchy was the first step outside of promiscuity; it was the very foundation of the family. Wilkin shows that upon the relation between the mother and child the remotest conception of the family was based.

The primal idea of family originated in this relationship. The child bore the mother's name; her authority over it was recognized as in accord with nature. The mother and child constituted the home, the father at first having no part in it; he remained a wanderer held in no esteem. The son as child of his mother ranked the father, and this priority of mother and child extended into religious observances. W. Robertson Smith shows that in the oldest Semitic cults, where a god and goddess were worshipped together, they are not husband and wife, but mother and son, the mother holding the first place. This form of deity dates to the earliest historical stage of society, the matriarchate.

Monogamy had its birth under the matriarchate. Neither promiscuity nor polygamy was extant, but a firmly established monogamy is shown by wide historic evidence wherever the mother-right, *i. e.*, matriarchy, existed.

The second step in family life took place when the father, dropping his own name assumed that of his child. Tylor gives numerous instances of this custom which is still extant on the island of Java, in Australia, in Madagascar. Through this step the father allied himself to both mother and child, although still holding an inferior position to both. The matriarchal family was now fully established, descent running in the female line. Abundant traces are still to be found over the globe; America, Asia, Africa, and the isles of the sea all preserving its records.

Thus we find that woman's liberty did not begin to-day, or under modern forms of government, but that she was in reality the founder of civilization. In the most remote times woman enjoyed superiority of rights in the family and in governments. Under the matriarchate, even its most degenerate forms, the governmental and marital rights of woman are even now more fully recognized than under any phase of Christian civilization. Among the State archives at Albany, N. Y., treaties are preserved signed by the "Sachems and Principal Women" of the Six Nations. In this wonderful confederacy of the Iroquois, upon whose form of government the historian Bancroft says our own was based, the condition of woman was superior. A council of Matrons existed to whom all disputed questions were submitted. Women possessed control of peace and war, Sir William Johnson giving instances where squaws forbade young Mohawk braves taking the war-path. In marriage among the Iroquois, if for any cause husband and wife separated, the wife took with her, not alone her own property, but also the children, which the unwritten law of the red man recognized as more fully belonging to her by the law of nature, than to the father. Descent ran in the female line, and many customs of the Matriarchate are still extant among the scattered remnants of this warlike confederacy, the most powerful of all nationalities found at time of its discovery, upon the continent of North America. Although among the Iroquois a female prisoner might be condemned to torture or the stake, yet her chastity was preserved inviolate.

Historians agree as to the high civilization of those nations or tribes still preserving some trace of matriarchal customs. Backofen, the celebrated Swiss jurist and author, says, "the people who possessed the mother-rule, together with Gynaikokraty (girl's-rule), excelled in their love of peace and justice."

One of the most brilliant modern examples of the Matriarchate was found in Malabar when discovered by the Portuguese in the fifteenth century. A high state of the arts and a superior civiliza-

tion existed. The Portuguese, amazed by the opulence of its cities, the great perfection of its navy, the superior organization of its army, the splendor of all habits of living, were no less surprised to find all their refinement under a family and governmental relation entirely contrary to that of Europe. At this period woman's position in England and on the Continent was that of household and political slavery. The Matriarchate can be traced in Malabar to the time of Alexander the Great.

Backofen (Mutterrecht p. 312) declares that among people of gynaikocratic habits, woman is of striking beauty and strength.

Female infanticide, so far from having been customary under the Matriarchate (as asserted by Prof. Cope), originated under the Patriarchate. Not until man became superior in the family, in government, in religion, do we find record of infanticide, or the immolation of children as a religious act. Not alone the destruction of female children at birth, but also the sacrifice of both male and female children as propitiation of an offended (male) deity, are equally due to the patriarchate. These were practices entirely out of consonance with woman's thought and life. Biblical Abraham binding Isaac for sacrifice to Jehovah, carefully kept this intention secret from Sarah. Passing children through the fire to Moloch, originated under the Patriarchate. Jephthah offering up his daughter in accordance with his vow is typical of the low regard for life, especially that of woman, under the patriarchate, during which period the destruction of girl children became a widely extended practice and infantile girl-murder the custom of many nations.

During the Matriarchate, or Mother-rule, all life was regarded as holy; even the sacrifice of animals was unknown. Like infanticide, prostitution with all its attendant horrors traces itself back through polygamy—its origin—to the Patriarchate, or Father-rule. Under the Matriarchate, daughters were free in the choice of husbands, no form of force existing. Through the Patriarchate they have been looked upon as slaves to be disposed of as the father should choose. Even in Christian lands, until within the last few decades, girls have been regarded as property and considered valuable in proportion to the political or other advantage they were likely to bring the father in the legal prostitution of a forced marriage. In France, to-day, the peasant who is the father of girls alone, if asked in reference to his family, mournfully replies, "I have no children, only daughters."

The hope of the world lies in the fact that woman not only realizes her position under patriarchal civilization, but is raising her voice in protest against it.

ABERDEEN, Dak. T., Jan. 5, 1889.

## SOCIAL OPPORTUNITIES AND MARRIAGE.

To the Editor of THE OPEN COURT:—

FOR Professor Cope, whom I knew in his explorations in the Bridger basin in Wyoming, I have the greatest respect. But his ideas of the solution of the marriage problem seem too radical.

After divorce there generally comes another, or two other marriages. This seems to show, not that marriage is a failure, but that the contracting parties got the wrong partners. The best means of preventing that would seem to be the formation of a more extensive circle of acquaintance previous to marriage, thus giving a larger number to choose from. There is no difficulty in a man establishing his business standing among strangers, if he has any. Why could not arrangements be made to establish his social standing in a similarly convenient way; *e. g.*, suppose I am en route to Chicago, or there, and see a lady whose appearance is such as to make me desire her acquaintance, why should I not be able to present a card with name and social standing, moral character, etc., with a request for permission to visit her at home? Outside of the small circle of one's acquaintances at home it is a

difficult matter to get acquainted with the ladies whom one sees and admires elsewhere. Some young folks lawlessly break through conventionalities and form acquaintance on sight by "flirting" (the lady flirting a handkerchief). And I have known some happy marriages in high life made that way. It is more likely that a man will suit himself out of a thousand acquaintances than among three hundred. There could be clubs in each town to exercise rigorous supervision over the members and answer inquiries. Whether the ladies should have the right of proposal too I will not pretend to decide; there seems to be nothing in nature against it. There are many men so immersed in business that they cannot get time to get wives; it would seem that it would be an advantage to them to be chosen.

Another matter that intimately concerns the permanency of marriage unions can only be hinted at here. The basic fact of marriage is usually kept in the background until after the public ceremony. When it is too late for a remedy the parties often find their ideas on this subject widely opposed. Men who would rather have no wife than a childless one find themselves married to women who want no children. Such a man finds no remedy but in divorce.

The union of one man with only one woman is his entire lifetime, lawless or lawful, seems to be nature's ultimate requirement; monogamy in the true sense of the word. This agrees with the law of progress.

Geo. Wilson.

LExINGTON, Mo.

### THE PHYSICAL BASIS OF MENDACITY.

To the Editor of THE OPEN COURT:—

ONE of the great daily newspapers of the country has referred somewhat unfeelingly to a tendency to mendacity on the part of the veterans of the late war.

The cruel and heartless manner in which it was done has provoked much well deserved criticism, nevertheless there was truth in the assertion and it would be better for the veteran to have the truth admitted and its cause elucidated.

In looking at the subjective face of mendacity, we find at once a retrograde metamorphosis of the victims' hemispherical ganglia. The cause of mendacity is pathological—as applied to the ex-soldier, it is one of the extreme outcomes of a degeneration of nerve-structure—the result of prolonged hardship to his nervous system.

The average ex-soldier aged before his time—nervous defects of varying degrees of severity are very common among these men—permanent abnormal conditions of motility, sensibility, and perversions of the special senses are observable to any competent person who looks for them.

The ex-soldier's hand trembles, his gait is unsteady, his memory and will are defective, and the heat-regulating mechanism of his body is permanently unhinged—all of which are nervous defects. The mental strain put upon the soldiers of the late war was immense—Sheridan was honest enough to admit it; he declared that he was emphatically afraid in battle and that courage was all a question of the influence of mind over body.

This I presume to have been General Sheridan's way of expressing the brain tension of a man, whose nerve-centres of ideation are functioning as courage in the presence of a great and keenly appreciated danger.

The nervous disabilities of ex-soldiers (one rare form of which is a tendency to mendacity) had their origin in the Neurokinesis\* of War.

And now somebody will ask, What about the bad habits of some of these men?—Yes, some of them did go to the bad and

\*The term Neurokinesis has recently been introduced to express in one brief word the cause of the common nervous troubles of old soldiers—it means a shaking up of the nervous system.

others are going there, and the wonder is that more have not gone there.

Did it ever occur to the reader that there is a physical basis of bad habits? The same nervous defects that provoke a craving for stimulants, also hold the will in abeyance and blunt reason, because the cerebral neurine, that functions as reason and will, is also defective.

No harm can come to ex-soldiers from a candid discussion of Soldier Mendacity.—This subject in the hands of demagogues will become a boomerang, but when carefully handled in the light of modern Neuropathology will benefit the veterans and prove a very interesting study to those who are competent to pursue it.

HORACE P. PORTER, M. D.

### POSTULATES VS. AXIOMS.

To the Editor of THE OPEN COURT:—

YOUR singularly excellent series of articles on "Form and Formal Thought" ought to set up that much needed movement in philosophical circles which no doubt you desire to excite. I believe that it will do so. Evidence of such a natural effect is afforded in a late issue of yours.

A contributor enters his protest against your disparagement of axioms and against Schopenhauer's dictum, that a science based on non-proven propositions remains non-proven itself.

It would seem tolerably plain that the strength of any consequence in a chain of reasoning is measured rigorously by the strength of its weakest antecedent, so that if what is meant is this merely, Schopenhauer's dictum is strictly invulnerable. The fallacy in Schopenhauer's dictum is that it is based upon the now fully exploded Cartesian theory of logic, which supposed that all valid reasoning is analogous to a chain composed of serial links of propositions, each absolutely dependent for its validity on some single antecedent. We now know that very strong conclusions result from the concurrence of a number of comparatively weak independent inferences. This alters the notion of proof entirely, and it follows by no means that a sufficient number of even unproved propositions may not, by their concurrence and united strength, establish a conclusion with any assigned grade of certainty.

This, however, is not the argument of the contributor. He will do battle with obsolete weapons on a field we consider as completely outflanked.

What is it that you advance that occasions his protest? Is it not this? You say that the entire frame of existence, physical and mental, is grounded in an immaterial transcendental subsistence, that is best termed Form. That without any significant error we may consider as subsisting, and may speak of, a world of form. That this world of form has its own facts, truths, and laws, which are capable of significant and useful cognition and expression, and that while this world of form with its facts, verities, and laws spreads vastly and indefinitely outside of the universe of actual existence, as that is commonly understood, its said facts, verities, and laws, so far as they can be made to apply, hold for the actual universe with entire rigor. In other words, the truths of actual existence are merely special instances of the more general formulae of the formal world.

You say also that research in the domain of formal thought has shown that axioms are not only illogical but unnecessary, and that the fundamental data of formal science are pure postulates, subject to no rule save the single rule of mutual consistency under the laws of mental operation.

This you do not leave to rest upon your deductions alone, but you prove it by citing a distinguished instance, in which an almost peerless mathematic has been deduced from postulates without axioms.

This is Hermann Grassmann's *Ausdehnungslehre*, a work that

yields to no other in rigor of demonstration and yet which possesses a search, power, and beauty altogether singular.

The contributor says that "it is far from certain that he (Grassmann) has succeeded." The contributor is certainly mistaken. The principles and methods of the *Ausdehnungslehre* are not easy to comprehend and have been shamefully neglected; but no infraction has been made upon their entire soundness. On the contrary, criticism has but disclosed the unique merits of the system and the study of the *Ausdehnungslehre* never fails to arouse the admiration and enthusiasm of every one who will take the pains to master its elements.

The contributor asks, "How does he (Grassmann) know that space has three dimensions?"

Here is misapprehension. Grassmann does not say it as an *ascertained* truth that space has three dimensions. What he says is in effect this: "I am able to formulate, by pure intellectual representations, a system of conditions wherein relations of co-existence and motion of a three-fold complexity may obtain." In other words he postulates, creates this form. He does not find it. It being his own creature he might name it as he chose, but because it happens that such a system agrees very closely with the ordinary notion of space, he adopts that name for reasons that are quite obvious.

The implications of formal thought are exemplified in a striking manner to the old fashioned type of comprehension, in connection with the idea of space of four dimensions.

By pure intellectual representation a system of conditions is formulated wherein relations of co-existence and motion of a four-fold complexity may obtain.

The elements of this system are *posited* not *found*. Whether or not any actuality exists to correspond, is wholly foreign to the motive. The system is a *figment*, a *pure form*. It subsists because of a mental *fact* and because of its formal *possibility*. For in the realm of formal thought, whatever can be formulated may be caused to subsist in virtue of that same formulation. In all this there is nothing really arbitrary. The formulation of formal systems is indeed exempt from the limitations of actual existence yet it is, nevertheless, rigorously conditioned. The form of the human mind gives laws of statement and process that are completely determinate.

Neither are such ideas really paradoxical. Space of four dimensions, or space of any order of dimensionality, has precisely the same ground of being and just the same title to consideration as has space of two dimensions or space of one dimension. Both of these are merely formal subsistences and if the contributor thinks otherwise, I ask him to apply the same kind of test that he will apply in the case of extra dimensionality. Let him make space of one or two dimensions contain any actual existence.

Again it is misapprehension that suggests the statements that Grassmann "makes use of axiomatic truths" and that "most of his postulates are merely axioms in disguise." All discourse, whether actual or tacit, proceeds in virtue and by means of systems of signs. Two sorts of elementary sign statements are all that logical discourse requires. The first sort comprises postulates and definitions both of which are essentially alike. That they may be and are usually stated in the form of propositions is not really significant. They are acts and expressions which refer exclusively to sign-systems. They affirm nothing but what is strictly relevant to the notation of the signs. Their sole office is to ascertain or state the proper meaning of those signs. Reason demands nothing in relation to them save that they shall be constant and consistent in view of the purpose for which they are posited.

The other sort are propositions, with a character and function of an entirely different kind. Propositions state conditions, processes, and events in general. Propositions affirm, predicate something. Hence of absolute necessity they must have a *material*

*content*. Unless they fulfill this indispensable condition they are only verbal shams and not propositions at all. Now an axiom is only a very plain proposition, so plain that the mind is at a loss to find any proposition more original. But as it is a proposition it is subject to the essential conditions necessary to constitute a proposition, and hence, unless it possess a material content, it is an abuse of sense and language to regard it as, or term it, an axiom.

I believe that if the contributor will look again he will perceive that Grassmann has studiously avoided using any proposition without deriving it logically from his postulates; that he will perceive that Grassmann's postulates are not offered as descriptions of what exists, but that the real effect of his utterance is: "Let there be supposed A, or B, or C, with properties and relations supposed to be D, or E, or F."

In my judgment the cardinal error that the contributor makes, he states thus: "All reasoning can be traced back to truths which cannot be derived from other truths and hence cannot be the result of reasoning."

Modern logic and the modern theory of cognition have effectually exploded this veteran theory of reasoning. Every cognition is determined by previous cognitions, and nowhere in the content of the mind is there to be found any iota of knowledge that cannot be explained as the product of mere inference operating upon prior cognitions either alone or combined with that which, although it causes knowledge, is not and can never become knowledge itself, namely, sense-presentation.

What is said as to the strength of our belief in axioms is wholly beside any logical question. Certainly may easily be a mere subjective conceit or feeling of conclusiveness and wholly mistaken. The history of belief would seem to dictate the utter neglect of certainty as a logical argument. Let us have truth for the sake of certainty, not certainty for the sake of truth.

FRANCIS C. RUSSELL.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

### CHAPTER XXX.—Continued.

"I know that the doubt arises often in my mind," the Sovereign murmured, "whether my unhappy skill has made them lies of human nature, or whether I myself am an automaton, which when wound up nods and repeats the same gracious words without thought. I know there are hours when I am ashamed of myself, when I strut about the stage as a clown or a bully; I see the wires that move my joints; I feel a desire to place my own head in the vice in order to improve what is faulty in it, and I see a large chest open into which I am thrown when my *rôle* is played out."

"Oh," he groaned, from the depths of his heart. "I know that I am a reality, if not by day, yet at night. None of those about me are tormented in lonely hours as I am; their temples do not beat with fever heat when they lie down after their day's work."

"What pleasure have I amidst these dull tapestry-rooms, or among the old pictures of Mother Nature? Laughing without amusement, angry about trifles,—everything cold, indifferent, and soulless!

"It is only in rare moments, when I have been with her, that I feel like another man; then the warm

\* Translation copyrighted.

blood courses through my veins. When in her honest simplicity she talks of all that she loves and takes pleasure in, a woman with a child's heart, then I become young again like her. She talked to me of her brother 'curly-head.' I see the boy before me, a lively lad, with his sister's eyes. I see the little simpleton eating his bread and butter, and it moves me as if I were reading a touching story. I long to catch up the boy in my arms as if he belonged to me.

"She herself is true and upright; it is a pure mind, and beneath her calm gentleness strong passion lies concealed. What a passion she fell into when my messenger offered her the patent of nobility! She is a woman to live with whom is worth some trouble, and to gain whom a man would do much.

"But what can I do? What I can give her will be of little value to her; what I take from her—how will she make up her mind to that?" He looked timidly at the empty place on the wall. "Another picture was to have hung there," he exclaimed; "why is it not there? Why does the remembrance of one long gone lie on my brain like a stone, the pressure of which I feel every day when mingling among men, and every night when I rest my weary head upon my hands? That woman slept many years ago in the same room where now the stranger reposes; she did not awake, as it would have been right for her to have done; when she did awake and came to consciousness, a spring broke in her weak mind, and she remained a soulless body."

A feverish shudder passed through him; he shook himself and rushed out of the gallery, looked shyly behind him, and closed the door.

"The violence of passion is extinguished," he continued, after a time; "with years one becomes more cautious. I will hold her fast, whatever may be the result; it is no longer the burning glow of youth, it is the heart of a ripened man that I offer to her. With firm patience will I await what time prepares for me; slowly will this fruit ripen in the warm sun. I shall persevere, but I will hold her fast. Her husband is becoming suspicious about her; it was an awkward excuse that he invented; he also is struggling out of my hand. I must keep her, and only childish means can be used for these childlike hearts."

The bell rang, the servant entered, and received an order.

Magister Knips appeared before the Sovereign; his cheeks were flushed, and vehement excitement worked in his features.

"Have you read the memorial which Professor Werner has written concerning the manuscript?" asked the Sovereign, carelessly. "What is your opinion of it?"

"It is a prodigious, astounding account, Most Gra-

cious Prince and Sovereign. I may well say that I feel this discovery in all my limbs. If the manuscript should be found, the fame attending the discovery will be imperishable; it would be discussed in the preface of every edition in which the question of the manuscript occurred, to the end of the world; it would raise the learned man to whose lot this greatest earthly good fortune should fall, high above his fellow mortals. Your exalted Highness also, according to Act 22, § 127, of the law of the country, would undoubtedly have the first right to the discovered treasure, and his Highness would be hailed among all people as the protector of a new era of knowledge concerning the Romans."

The Sovereign listened with satisfaction to the enthusiasm of the Magister, who in his excitement forgot his humble bearing, and pathetically stretched out his arm in the direction in which he saw the radiant crown hovering above the head of the Sovereign.

"All this would occur if one found the treasure," said the Sovereign; "but it is not yet found."

Knips collapsed.

"Undoubtedly it is presumptuous to think that such a happiness could fall to the lot of any human being, yet it would be a sin to doubt its possibility."

"Professor Werner seems to attach much value to the discovery," rejoined the Sovereign, indifferently.

"He could not be a man of sterling judgment who did not feel the importance of this gain as much as does your Highness's most humble servant and slave."

The Sovereign interrupted the speaker.

"Mr. Von Weidegg has proposed to you to remain in my service. Have you agreed to do so?"

"With the feelings of a rescued man," exclaimed Knips, "who ventures to lay at your Highness's feet thanks and blessing with unbounded veneration."

"Have you already engaged yourself?"

"In the most binding way."

"Good," said the Sovereign, stopping the stream of the Magister's respectful assurances by a motion of his hand. "It has been reported to me, Magister that you have a special good fortune in finding such rarities—good fortune," repeated the Sovereign, "or what comes to the same thing, skill. Do you seriously believe that these indistinct traces will lead to the lost treasure?"

"Who can now maintain that such a discovery is impossible?" cried the Magister. "If I might be allowed, with the deepest respect, to express my views, which burst forth from my heart like a cry of joy, it is, I dare not say probable, but yet not improbable, that an accident might lead to it. Yet if I may venture respectfully to express my experience, which perhaps is only a superstition, if the manuscript be found, it will not be found where one expects, but somewhere

else. Hitherto whenever in my humble existence I have had the good fortune of making a discovery—I mention only the Italian Homer of 1848—it has always been contrary to all anticipations; and what your most exalted Grace calls my skill is—if I must explain the secret of my good fortune—really nothing but the circumstance that I have generally sought where, according to human probability, no treasure could be supposed to lie."

"The views which you entertain are certainly not solacing for an impatient person," said the Sovereign, "for that may last a long time."

"Generations may pass away," replied Knips, "but the present and the future will search until the manuscript be found."

"That is but poor comfort," said the Sovereign, laughing; "and I confess, Magister, you disappoint by these words the lively expectation which I cherished, that your dexterity and skill would soon obtain for me the pleasure of seeing the book in the hands of the Professor—the book itself, or at least some palpable proof of its existence. I am a layman in all these things, and can form no judgment of the importance which you attach to the discovery. To me at present it is only to play off a joke, or—to repeat the words which you lately used with respect to your miniatures—only for the sake of raillery."

The expression and manner of the Magister altered gradually, as if under the spell of an enchanter; he shrank into himself, laid his head on his shoulder, and looked with a terrified eagerness at the Sovereign.

"In short, I wish that Mr. Werner should soon be put upon a certain trace of the manuscript, if it is not possible to obtain the manuscript itself."

Knips remained silent, staring at the speaker.

"I desire you," continued the Sovereign, emphatically, "to employ the talent you have already shown for this object. Your help must, of course, remain my secret, for I should like Mr. Werner to have the pleasure of making the discovery himself."

"It must be a large manuscript," stammered out Knips.

"I fear," replied the Sovereign, carelessly, "it must long have been torn to pieces. It is not impossible that some scattered leaves may have been preserved somewhere."

The Magister stood thunderstruck.

"It is difficult to satisfy the Professor."

"So much the greater will be your merit and reward."

Knips remained silent, in a state of terror.

"Has your confidence vanished, Magister?" said the Sovereign, ironically. "It is not the first time that you have succeeded in such a discovery." He approached closer to the little man. "I know something

of former trials of your dexterity, and I have no doubt of the comprehensiveness of your talent."

Knips started, but still he remained speechless.

"For the rest, I am contented with your activity," continued the Sovereign, in a changed voice. "I do not doubt that you will in many ways know how to make yourself useful to the officials of my Court, and thereby consult your own future interest."

"What high honor!" said Knips, pitifully, drawing out his pocket-handkerchief.

"As regards the lost manuscript," continued the Sovereign, "the stay of Mr. Werner will, I fear, be only temporary. The task of pursuing the investigations in our country would, in that event, fall upon you."

Knips raised his head, and a ray of pleasure passed over his troubled face.

"If the manuscript is, in fact, as valuable as the learned gentlemen seem to think, then in case, after the departure of the Professor, there is still something to discover, you will have found with us an occupation which is especially suited to you."

"This prospect is the highest and most honorable which my life can attain to," replied Knips, more courageously.

"Good," said the Sovereign; "endeavor to deserve this claim, and try first what your dexterity can do."

"I will take pains to serve your Highness," replied the Magister, his eyes cast on the ground.

Knips left the private apartment. The little man, who now descended the staircase, looked very different from the happy Magister who a few minutes before had ascended it. His pale face was bent forward, and his eyes wandered furtively over the faces of the servants, who watched him inquisitively. He seized his hat mechanically, and he, the Magister, put it on his head while still in the royal castle. He went out into the court; the storm swept through the streets, whirled the dust round him, and blew his coat-tails forward.

"He drives me on; how can I withstand him?" murmured Knips. "Shall I return to my proof-sheets in that cold room? Shall I all my life depend on the favor of professors, always in anxiety lest an accident should betray to these learned men that I once overreached them and derided them?"

"But here I pass a pleasant life, and have opportunities of being the cleverest among the ignorant and making myself indispensable to them! I am so already; the Sovereign has shown himself to me as one comrade does to another, and he can, if I do as he wishes, as little part from me as the parchment from the writing on it."

He wiped the cold sweat from his brow.

"I myself will find the manuscript," he continued,

more confidently. "*Jacobi Knipsii sollertia inventum.* I know the great secret, and I will search day by day where only a wood-louse can creep or a spider hang its web. Then it will be for me to decide whether I shall take the Professor as an assistant to edit it, or another. Perhaps I will take him and he will be thankful to me. He will hardly find the treasure, he is too dignified to listen and to spy out where the chests are concealed."

The Magister hastened his steps; the wind whistled in sharp tones behind him,—it tore from the trees the dry leaves of the last year, and scattered them on the hat of the little man. The dust whirled more rapidly round him; it covered the dark Court dress with a pale grey coating, it pursued and enveloped him, so that the foliage of the trees and the figures of men disappeared from his sight, and he hastened onward wrapped in a cloud of dust and dead leaves. Again he raised his pocket-handkerchief, sighed, and wiped the perspiration from his temples.

#### CHAPTER XXXI.

##### HUMMEL'S TRIUMPH.

THERE was a lowering sultriness in nature, and also in the busy world of men. The barometer fell suddenly; thunder and hail coursed over the country; confidence was gone, stocks became worthless paper; lamentation followed arrogance; water stood in the streets; and the straw hats disappeared as if wafted away by the storm.

Whoever in these changing times might wish to observe Mr. Hummel in a good-humored frame of mind must do so in the afternoon before three o'clock, when he opened his garden door and seated himself near the hedge. During this hour he gave audience to benevolent thoughts; he listened to the striking of the city clock, and regulated his watch; he read the daily paper, counted the regular promenaders, who daily walked at the same hour to the wood and back again to the city, and he accosted his acquaintances and received their greetings. These acquaintances were for the most part householders, hard-headed men, members of the city commissions, and councillors.

To-day he was sitting at the open door, looking proudly at the opposite house, in which some secret commotion was perceptible; he examined the passers-by, and returned with dignity the bows and greetings of the citizens. The first acquaintance was Mr. Wenzel, a gentleman of means, and his sponsor, who for many years had taken a constitutional every day, summer and winter, through the meadows to get into perspiration. It was the one steady business of his life, and he talked of little else.

"Good day, Hummel."

"Good day, Wenzel. Any success to-day?" asked Mr. Hummel.

"Pretty fair, only it took a long time," said Mr. Wenzel, "but I must not stop. I only wanted to ask you how things are going with him over the way?"

"Why that?" asked Hummel, annoyed.

"Do you not know that his book-keeper has disappeared?"

"What!" exclaimed Mr. Hummel.

"They say he has speculated on the stock exchange, and escaped to America. But I must be off; good day."

Mr. Wenzel hastily departed.

Mr. Hummel remained in a state of great astonishment. He heard the voice of the city-councillor calling out:

"Good day, Mr. Hummel—a warm day—90 degrees in the shade. Have you heard?" he said, pointing with his stick to the neighboring house.

"Nothing," cried Hummel; "one lives in this place like in a prison. Whether it is fire, pestilence, or the arrival of high personages, it is only by pure accident one hears of it. What is all this about the absconding book-keeper?"

"It appears that your neighbor placed too much confidence in the man, and he has secretly used the name of his employer in some mad speculations, and fled last night. They say it is to the amount of forty thousand."

"Then Hahn is ruined," said Hummel, "irredeemably. I am not surprised at it; the fellow has always been impractical."

"Perhaps things are not so bad," said the councillor, as he left him.

Mr. Hummel remained alone with his thoughts "Naturally." He said to himself, "It was inevitable. In everything, high-flown—houses, windows, and garden fancies—never any rest; the man is gone out like a candle."

He forgot the passers-by, and moved backwards and forwards on his main walk, looking sometimes with curiosity at the hostile house. "Out like a candle," he repeated, with the satisfaction of a tragic actor who endeavors to give the most terrific expression to the telling words of his rôle. He had vexed himself half a century about that man; before his disposition to corpulency had begun, he had despised this man's ways and business. This feeling had been his daily entertainment; it was one of his daily necessities, like his boot-jack and his green boat. Now the hour was come when fate paid off the man over the way for having injured Mr. Hummel by his presence in life. Hummel looked at the house and shrugged his shoulders; the man who had placed that deformed structure before his eyes was now in danger of being driven out of it.

(To be continued.)

## BOOK REVIEWS.

DIE ENGLISCHE FABRIK-INSPEKTION. Ein Beitrag zur Geschichte der Fabrikgesetzgebung in England. Otto W. Weyer, Elmir, N. Y. Tübingen: 1888. H. Laupp.

The necessity of legislative interference in the regulation of the relations of employer and employed, in the shops and factories of England, became first apparent towards the close of the last and the beginning of the present century. The inventive talent and commercial genius of the British people had secured for their industrial products the foremost place in the markets of the world; in England the monopoly of international manufactures centered.

To ensure beyond chance of overthrow the position thus attained, no effort was spared nor course untried to increase the productivity of English labor and English capital. The latter resulted in the inventorial activity that marks this era of industrial progress, while the former found its immediate expression in the reduction of wages and the extension of the hours of daily employment. Aggravated by the selfishness and inhumanity of the manufacturers, who were originally favored in their projects by local conditions, the policy of individualism led in time to the oppression and virtual enslavement of the working population. The first enactment of Parliament, passed in 1802, regulated merely the employment of children. From the faulty measures taken to ensure its enforcement, it remained ineffective. The same difficulties attended the various subsequent attempts at legislative interposition prior to 1831. Not until the stirring events of the early part of the Thirties did the intervention of State authority bear fruit of promise; in 1833 the Factory Inspection Acts were passed; from the enactment of these measures begins the long course of Factory legislation which has materially altered the conditions of English industrial life and exerted a beneficent influence upon the welfare of the working population. This direction of legislative action in England, constitutes the topic with which the historical and critical investigations of Mr. Weyer deal.

The subject falls naturally into two lines of treatment, which are carried side by side throughout the work: *First*, the history and genetic development of Factory legislation, the extent and content of its provisions, with the consequent effect upon the classes in whose interests State intervention was demanded. *Second*, the economical and political significance, from a scientific standpoint, of an institution so opposed in principle to the prevailing theories of political economists.

Mr. Weyer says he has found nowhere a politico-economical vindication of the English Factory legislation. In England the question is evaded; on the Continent, the fear of disastrous economical results has hindered the proper solution of the problem; while in America, we are committed, in theory at least, to a policy quite the opposite. The very advocates of this departure from the traditional doctrines of political economy did not originally advance arguments to support it; motives of justice and humanity gave the first impulse to the movement. On the side of the opposition were ranged the theorists and *doctrinaires* of the dominant schools of political science, whose predictions of economical ruin met with no formal refutation. But the prosperity of the national industries remained unimpaired and the work of the Factory Inspectors was eminently successful. The latter, in the supervision of their broad province and the management of the vast material under their care, became an important power in shaping the practical economical policy of the nation; they justified by their success the principles on which State intervention had been based, and they guided by the intelligent exercise of their duties the future course of legislative interposition. The results of their activity have shattered the foundation upon which the *laissez-faire* economists based their doctrines.

We are prevented from following Mr. Weyer in his masterly

argument supporting the policy of State intervention from a purely scientific standpoint, and must refer our readers to the expositions of the work. The sources from which the author has drawn are throughout original. Based upon the irreversible groundwork of facts, and free from all speculative discursiveness, the line of reasoning followed and the conclusions reached are admirably illustrative of the inductive method of modern Political Science and of the careful personal judgment that such investigations require.

THE ENGLISH RESTORATION AND LOUIS XIV. (Epochs of Modern History.) By Osmond Airy, M. A. New York: 1889. Charles Scribner's Sons. Chicago: A. C. McClurg & Co.

The latest issue in the series "Epochs of Modern History," treats of the period extending from the Peace of Westphalia to the Peace of Nimwegen. As manuals of history these little works have met with a deserved and unprecedented success. With few exceptions the authors have been men of international authority, and in many instances their productions have exhibited marks of pre-eminent historical talent. For the purposes of the general reader, no other method is better adapted to afford the requisite introduction into historical study.

The epoch assigned to Mr. Airy is a period of European history perplexing to the historian. The Peace of Westphalia had reconstructed the foundations of international politics. The era of ecclesiastical government gave way to the dominance of secular and national tendencies. The age of modern diplomacy with its intricacy, secrecy, and exclusiveness began. So that apart from the difficulty which this makes a careful study of details necessary to the proper understanding of the events enacted, the altered character of the movements of society and politics involve a careful and discriminative handling of precedent causes. To those who have studied Mr. Gardiner's excellent and exemplary monograph upon the Thirty Years War,—in the same series,—the latter obstacle is easily surmountable.

Mr. Airy has given a graphic and interesting presentation of the period. The maps are more numerous and fuller than in former numbers of the series.

## NOTES.

The article of Wheelbarrow upon Henry George and Land-Taxation, has evoked considerable discussion. Critical remarks from our correspondents will appear in the next issue of THE OPEN COURT.

A number of citizens of California, we are informed by Mr. S. P. Putnam, the editor of *Free Thought*, met in San Francisco, on Jan. 27, to form a liberal organization, auxiliary in its action and aim to the American Secular Union. Protest is made against the least interference of State in matters of religion. It is demanded that in the exercise of Federal and State governmental power, no privilege or advantage shall be conceded to Christianity or any other special religion, but that our entire political system shall be founded and administered on a purely secular basis.

At the International Convention of Women held at Washington in March, 1888, a permanent National Council was projected, whose purpose, as expressed in its constitution, is to effect a confederation of the local councils and lesser organizations of women throughout the United States, in the effort "to overthrow all forms of ignorance and injustice, and to apply the golden rule to society, custom, and law. The best good of our homes and nation will be advanced by the greater unity of thought, sympathy, and purpose." The officers of the National Council have issued an Address to all national organizations of women, inviting them to become auxiliary to the Council by formal action. Reports are to be sent to Mrs. May Wright Sewell, Indianapolis, Ind.

## PUBLICATIONS OF "THE OPEN COURT."

## The Marriage Problem.

By E. D. COPE, Ph.D.  
PRICE, 15 CENTS.

A scientific discussion, from a practical standpoint, of the question now engrossing the public attention.

P. O. Drawer F, Chicago, Illinois.

150% PROFIT TO BOOK AGENTS!  
Ourselves. CHARLES H. KILB & CO., CHICAGO

## LUCIFER THE LIGHT BEARER!

Holds 10-day the Position of Advance Picket on the Danger Line of the Army of Aggressive and Progressive Journals. For more than two years it has been singled out for prosecution in the Courts by the enemies of Free Speech and Free Press.

Ninth year of Publication. Published weekly at Valley Falls, Kansas at one dollar and twenty-five cents per annum. Send twenty-five cents in stamps for a trial subscription of three months.

## SCIENTIFIC AMERICAN

ESTABLISHED 1845.

Is the oldest and most popular scientific and mechanical paper published and has the largest circulation of any paper of its class in the world. Fully illustrated. Best class of Wood Engravings. Published weekly. Send for specimen copy. Price \$3 a year. Four months trial. L. MUNN & CO., PUBLISHERS, 361 Broadway, N. Y.

## ARCHITECTS &amp; BUILDERS

Edition of Scientific American.  
A great success. Each issue contains colored lithographic plates of country and city residences or public buildings. Numerous engravings and full plans and specifications for the use of such as contemplate building. Price \$2.50 a year, 25 cts. a copy. MUNN & CO., PUBLISHERS.

## PATENTS

May be secured by applying to MUNN & CO., who have had over 40 years' experience and have made over 100,000 applications for American and Foreign patents. Send for Handbook. Correspondence strictly confidential.

## TRADE MARKS.

In case your mark is not registered in the Patent Office, apply to MUNN & CO., and procure immediate protection. Send for Handbook. COPYRIGHTS for books, charts, maps, etc., quickly procured. Address

MUNN & CO., Patent Solicitors.  
GENERAL OFFICE: 361 BROADWAY, N. Y.

## THE

## TWENTIETH CENTURY

HUGH O. PENTECOST, Editor.

Issued weekly. Contains besides other interesting matter, the Sunday addresses of Hugh O. Pentecost, the famous agnostic and political economist. Devoted to the betterment of this world as the best preparation for any possible other world.

Annual Subscription, One Dollar.

Subscribers will receive as a premium a copy of Mr. Pentecost's book "What I Believe."

Sample Copies sent free.

Address FRED C. LEUBUSCHER,  
38 Park Row,  
NEW YORK CITY.

## "Free Thought,"

A Liberal Journal.

Published Weekly at 504 Kearney Street,  
San Francisco, Cal.

## Editors:

SAMUEL P. PUTNAM, President American Secular Union.

GEO. E. MACDONALD, Formerly with the New York Truth Seeker.

Mr. Putnam is lecturing in the Pacific States and his "News and Notes" of travel are an interesting feature of the paper.

## SUBSCRIPTION RATES:

504 Kearny St., San Francisco, Cal.

## SHELLS, MINERALS &amp; FOSSILS

—Also—

## SEEDS and PLANTS.

C. R. ORCUTT, Publisher,

The West American Scientist,

SAN DIEGO, CALIFORNIA.

## WANTED!

An energetic and educated person wanted in every town, city, and district, to canvass for subscriptions to *The Open Court*; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,  
P. O. Drawer F., Chicago, Illinois.

## Scientific Pamphlets.

THE OPEN COURT is in receipt of a number of the latest re-publications of the *Naturwissenschaftliche Wochenschrift*,

in pamphlet form, which will be sent post-paid to any address for 20 Cents each.

DR. V. SCHLEGEL. Ueber den sogenannten vierdimensionalen Raum.  
PROF. DR. A. SCHUBERT. Das Rechnen an den Fingern und Maschinen.

PROF. DR. KARL KRAEPELIN. Die Bedeutung der naturhistorischen, insbesondere der Zoologischen Museen.

PROF. DR. E. LOEW. Anleitung zu blüten-biologischen Beobachtungen.

THE OPEN COURT PUB. CO.,

169-175 La Salle Street, Chicago, Illinois.

P. O. Drawer F.

"The Week, one of the ablest papers on the continent."—*Descriptive America*.

ENLARGED AND IMPROVED.

## "THE WEEK,"

A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.  
\$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first-class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained; and unceasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns, and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLDSMITH SMITH will, from time to time, contribute articles, London, Paris, Washington and Montreal letters from accomplished correspondents will appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

Send for Free Sample Copy.
